UNIT 12 어휘 적절성 파악

Gate W

Everywhere we turn we hear about almighty "cyberspace"! The hype promises that we will leave our boring lives, put on goggles and body suits, and enter some metallic, three-dimensional, multimedia other world. When the Industrial Revolution arrived with its great innovation, the motor, we didn't leave our world to go to some remote motorspace! On the contrary, we brought the motors into our lives, as automobiles, refrigerators, drill presses, and pencil sharpeners. This absorption has been so complete that we refer to all these tools with names that declare their usage, not their "motorness." These innovations led to a major socioeconomic movement precisely because they entered and affected profoundly our everyday lives. People have not changed fundamentally in thousands of years. Technology changes constantly. It's the one that must adapt to us. That's exactly what will happen with information technology and its devices under human-centric computing. The longer we continue to believe that computers will take us to a magical new world, the longer we will *delay* their natural fusion with our lives, the hallmark of every major movement that aspires to be called a socioeconomic revolution.

*hype 과대광고 **hallmark 특징

우리가 고개를 돌리는 곳 어디서든 우리는 전능하신 '사이버공간'에 대해 듣는다! 과대 광고는 우리가 지루한 삶을 떠나 고글과 바디 수트를 착용하고, 어떤 금속성의, 3차원의, 멀티미디어로 만들어진 다른 세계로 들어갈 것이라고 약속한다. 위대한 혁신인 모터와 함께 산업혁명이 도래했을 때 우리는 어떤 외딴 모터 공간으로 가기 위해 우리의 세상을 떠나지 않았다! 반대로, 우리는 모터를 자동차, 냉장고, 드릴 프레스, 연필깎이와 같은 것들로 우리 삶에 가져왔다. 이 흡수는 매우 완전해서 우리는 그것들의 '모터성'이 아니라 그것들의 사용을 분명하게 밝히는 이름으로 이 모든 도구를 지칭한다. 이러한 혁신품들은 정확히 우리의 일상생활에 들어와 깊은 영향을 미쳤기 때문에 주요한 사회경제적 운동으로 이어졌다. 사람들은 수천 년 동안 근본적으로 변하지 않았다. 기술은 끊임없이 변화한다. 우리에게 적응해야 하는 것은 바로 그것이다. 그것이 바로 정보 기술과 그 장치들이 인간 중심의 컴퓨터 사용 하에 일어날 일이다. 컴퓨터가 우리를 마법 같은 신세계로 데려다줄 것이라고 계속해서 더 오래 믿게 될수록 컴퓨터와 우리 삶의 자연스러운 융합이 더 오래 유지될(→ 지연될) 것인데, 이는 사회경제적 혁명이라고 불리기를 열망하는 모든 주요 운동의 특징이다.

01

On April 12, 1955, the day that the US government announced that the new polio vaccine was safe and effective, its inventor, Jonas Salk, was asked on television who owned the vaccine. He famously replied, “Well, the people, I would say. There is no patent. Could you patent the sun?” The vaccine was common property; it *belonged to* the people who had donated money for the public interest. Salk was *later* pitied for his decision. He ***could have earned*** $7 billion if his vaccine ***had been patented***. His attitude to patenting, however, is not unique. Even in the era of excessive property protection, there is a new interest in open sources and access, global goods, and the notion of the commons. Elon Musk, CEO of Tesla Motors, decided in June 2014 to *release* all of his patents. Technological leadership is not defined by patents. The future of sustainable transport will be better served by openly sharing information and knowledge. “All our patents *belong to* you.”

* polio: 소아마비

1955년 4월 12일, 미국 정부가 새로운 소아마비 백신이 안전하고 효과적이라고 발표한 날, 발명가인 조나스 솔크(Jonas Salk)는 텔레비전에서 누가 백신을 소유했는지 질문 받았습니다. 그는 유명한 대답을 했습니다. 특허가 없습니다. 태양에 특허를 낼 수 있습니까?” 백신은 공동 재산이었습니다. 그것은 공익을 위해 돈을 기부한 사람들의 것이었다. Salk는 나중에 그의 결정에 대해 동정을 받았습니다. 그의 백신이 특허를 받았다면 그는 70억 달러를 벌 수 있었을 것입니다. 그러나 특허에 대한 그의 태도는 독특하지 않았습니다. 과도한 재산 보호 시대에도 오픈 소스와 액세스, 글로벌 상품, 커먼즈 개념에 대한 새로운 관심이 있습니다. Tesla Motors의 CEO인 Elon Musk는 2014년 6월 모든 특허를 공개하기로 결정했습니다. 기술 리더십은 특허로 정의되지 않습니다. 지속 가능한 운송의 미래는 공개적으로 정보와 지식을 공유함으로써 더 나은 서비스를 제공할 것입니다. "우리의 모든 특허는 당신의 것입니다."

숙어 정리 - to 를 주로 사용하는 숙어 to가 전치사이기 때문에 반드시 뒤에 명사와 같이 쓰고, ‘to+명사’ 가 부사구 대용으로 쓰인다.

belong to~ :~ 에 속하다 refer to A (as B) : ~를 언급하다 stick to ~ : 굳게 지키다, 고수하다 참조: You don't belong **here** (또는 to this place)

어법 정리 - 가정법 과거완료: 과거 사실의 반대

if S had p.p ~, S w/c/s/m + have p.p ~ [전에 ~했다면, ~했을 텐데] If I had been rich, I could have bought the car.

02

By the early 1990s, the decline of the southwestern willow flycatcher was clear. In 1993, the U.S. Fish and Wildlife Service (FWS) formally proposed listing the flycatcher as a federal endangered species and designating critical habitat, an important step under the Endangered Species Act that prevents damage to specific areas. The task of writing the rule that listed the bird as endangered under the act fell to Rob Marshall. Marshall, a Yale-trained biologist with FWS in Arizona, was becoming ***disillusioned*** by the overall implementation of the Endangered Species Act. The FWS was highly politicized by powerful, moneyed interests that saw species listings and particularly habitat designations as a threat to business: if a species is listed but no critical habitat is designated, a now-common pattern, then restrictions on business are far fewer. This created an atmosphere in which it was extremely difficult for technical biological staff to maintain their integrity, says Marshall. For example, the process to list the flycatcher as endangered began in 1992, the proposed rule didn't come out until 1995, and it took until 1997 to produce the final ruling to list it. The FWS only completed the listing because the watchdog organization Center for Biological Diversity sued them.

* willow flycatcher: 버드나무 딱새 ** implementation: 시행, 이행 *** integrity: 변함없는 원칙 고수, 무결함

1990년대 초에 이르러 남서부의 버드나무 딱새의 감소가 뚜렷했다. 1993년, 미국 어류·야생동물 관리국(FWS)은 딱새를 연방 멸종 위기종으로 등재하고 보존 서식지를 지정할 것을 공식적으로 제안했는데, 이는 특정 지역의 피해를 예방하는 멸종 위기종 법령에 따라 이루어진 중요한 조치였다. 그 법령에 따라 그 새를 멸종 위기종으로 등재하는 규칙을 작성하는 일이 Rob Marshall에게 돌아갔다. Arizona 주의 FWS 소속으로 Yale대학에서 교육받은 생물학자인 Marshall은 멸종 위기종 법령의 전반적인 시행에 환멸을 느껴가고 있었다. FWS는 종의 등재, 특히 서식지 지정을 사업에 대한 위협으로 보는 강력하고 돈 많은 이해관계자들에 의해 매우 정치화되어 있었다. 현재 흔한 패턴인데, 어떤 종이 등재되지만 보존 서식지가 지정되지 않으면, 사업에 대한 제한이 훨씬 더 적기 때문이다. 이것으로 인해 기술 생물학 직원들이 변함없는 원칙 고수를 유지하는 것이 극도로 어려운 분위기가 만들어졌다고 Marshall은 말한다. 예를 들어, 딱새를 멸종 위기종으로 등재하려는 과정은 1992년에 시작되었지만, 제안된 규칙은 1995년에서야 나왔으며, 그것을 등재하기 위한 최종 판결은 1997년이 되어서야 나왔다. FWS는 감시 단체 조직인 생물학적 다양성 센터가 그들을 고소했기 때문에 등재를 마쳤을 뿐이었다.

03

Translating theory into something that can be assessed in the physical environment means that phenomena are made measurable. It is often assumed that the phenomenon being measured is the same no matter how it is measured. Translations of theory into practice may differ, but these do not alter the nature of the phenomenon being measured. ***Without*** this assumption, measurement between different individuals made in different places or at different times ***could not be compared***. The assumption does not, however, mean that this viewpoint is correct. Within quantum physics there is a view ***that*** the observer and the phenomenon cannot be separated. The observer and phenomenon make up a single system, a measurement system. In this context it is not possible to separate the measurement made from the measurement system within which it was made. The measurement and the phenomenon become combined in an unbreakable link in the measurement system. It is impossible to talk of a separate existence for the phenomenon and so also, therefore, to talk of an independent measurement of that phenomenon. This means that within the supposedly objective, hard science of physics, it is *accepted* that reality and how it is measured form an inseparable whole.

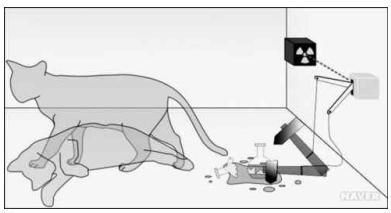
이론을 물리적 환경에서 평가할 수 있는 것으로 변환한다는 것은 현상을 측정 가능하게 만든다는 것을 의미합니다. 측정되는 현상은 측정 방법에 상관없이 동일하다고 가정하는 경우가 많습니다. 이론을 실제로 번역하는 것은 다를 수 있지만 이것이 측정되는 현상의 본질을 바꾸지는 않습니다. 이 가정 없이는 다른 장소 또는 다른 시간에 이루어진 다른 개인 간의 측정을 비교할 수 없습니다. 그러나 이러한 가정이 이 관점이 옳다는 것을 의미하지는 않습니다. 양자물리학에서는 관찰자와 현상을 분리할 수 없다는 견해가 있습니다. 관찰자와 현상은 하나의 시스템, 즉 측정 시스템을 구성합니다. 이러한 맥락에서 측정이 이루어진 측정 시스템에서 측정을 분리하는 것은 불가능합니다. 측정과 현상은 측정 시스템에서 끊어지지 않는 연결 고리로 결합됩니다. 현상에 대한 분리된 존재에 대해 이야기하는 것은 불가능하며, 따라서 그 현상에 대한 독립적인 측정에 대해 이야기하는 것도 불가능합니다. 이것은 아마도 객관적이고 엄격한 물리학 내에서 현실과 그것을 측정하는 방법이 분리할 수 없는 전체를 형성한다는 것이 받아들여진다는 것을 의미합니다.

어법 정리 - 가정법 if 생략 (조건문도 가능)

과거 If it were not for / were it not for / but for / without~ S w/c/s/m + 동원 ~ [지금 ~없다면, ~할텐데]

어법 정리 - that 구분

동격 접속사 I know the fact **that** the team is called BTS. ① 앞에 동격인 명사 **있음** ② 뒤에 명사가 **생략되지 않음** (완전)



'측정' -> 상자 안의 고양이가 어떤 상태인지를 확인해 봄

양자역학에서 '측정'할 때는 고양이가 살거나 죽거나 중 하나의 '현상'을 가질 수 있지만, '측정'하지 않을 때는, 고양이가 산 상태와 죽은 상태가 동시에 존재 할 수 있으므로 윗글은 '측정'과 '현상'을 불리할 수 없다고 주장한다.

*참조: 슈뢰딩거의 고양이는 빛 2중 슬릿 실험을 비꼬기 위해 슈뢰딩거가 제안하였으나, 그 반대로 빛 2중 슬릿 현상을 설명하는데 인용됨. 아인슈타인은 양자역학 이론을 좋아하지 않았음.

04

Why are certain languages mistakenly thought to be primitive? There are several reasons. Some people consider other languages ugly or "primitive sounding" if those languages make use of sounds or sound combinations they find *unclear* because the sounds are greatly different from those of the languages they themselves speak. Such a view is based on the ethnocentric attitude that the characteristics of one's own language are obviously superior. But words that seem unpronounceable to speakers of one language — and are therefore considered obscure or even grotesque — are easily acquired by even the youngest native speakers of the language in which they occur. To a native speaker of English, the Czech word *scvrnkls* "you flicked off (something) with your finger" looks quite strange, and its pronunciation may sound odd and even impossible because there is no vowel among the eight consonants; for native speakers of Czech, of course, *scvrnkls* is just another word. Which speech sounds are used and how they are combined to form words and utterances vary from one language to the next, and speakers of no language can claim that their language has done the selecting and combining better than another.

* obscure: 불분명한, 이해하기 어려운 ** grotesque: 괴상한 *** flick: (손가락 등으로) 튀기다

왜 특정한 언어는 원시적이라고 잘못 생각되는가? 몇 가지 이유가 있다. 어떤 사람들은 소리가 자신이 쓰는 언어의 소리와 매우 달라서 그들이 보기에 불분명하다고 생각하는 소리나 소리의 결합을 다른 언어가 사용한다면 그 언어를 흉하거나 '원시적으로 들리는' 것으로 여긴다. 그러한 견해는 자기 언어의 특징이 명백히 우수하다는 자기 민족 중심적인 태도에 근거한다. 그러나 어느 한 언어의 사용자에게 발음하기 너무 힘들어 보이는 단어들, 그리고 그렇기 때문에 불분명하거나 심지어 괴상하다고 여겨지는 단어들은 그것들이 나타나는 언어의 가장 어린 현지인 화자조차 쉽게 습득한다. 영어 모국어 화자에게, "당신이 손가락으로 (무언가를) 튀겼다"라는 체코어 단어 'scvrnkls'는 상당히 이상하게 보이며, 8개의 자음 사이에 모음이 없기 때문에 발음이 이상하고 심지어 불가능하게 들릴 수 있지만, 체코어 모국어화자에게는 물론 'scvrnkls'는 그저 또 하나의 (보통) 단어일 뿐이다. 어떤 말소리가 사용되고, 그것들이 어떻게 결합하여 단어와 발화를 구성하는지는 언어마다 다르며, 어떤 언어 사용자도 자신의 언어가 다른 언어보다 선택과 결합을 더 잘했다고 주장할 수 없다.

For example, the process to list the flycatcher as endangered began in 1992, the proposed rule didn't come out until 1995, and it took until 1997 to 31) **produce/ reduce** the final ruling to list it. The FWS only completed the listing 32) **because/ because of** the watchdog organization Center for Biological Diversity sued them.

03

Translating theory into something that can be 33) **assessed/ accused** in the physical environment means that phenomena 34) **made/ are made** measurable. It is often assumed 35) **that/ what** the phenomenon

being measured is the same no matter how it is measured. Translations of theory into practice may differ, but these do not 36) **alter/ alert** the 37) **nature/ nurture** of the phenomenon being measured. Without this assumption, measurement between different individuals 38) **made/ making** in different places or at different times could not be compared. The assumption does not, however, mean 39) **that/ what** this viewpoint is correct. Within quantum physics there is a view 40) **that/ what** the observer and the phenomenon cannot be separated. The observer and phenomenon make up a single system, a measurement system. In this context 41) **this/ it** is not possible to separate the measurement made from the measurement system 42) **which/ within which** it was made. The measurement and the phenomenon become 43) **consumed/ combined** in an unbreakable link in the measurement system. It is impossible to talk of a separate existence for the phenomenon and so also, therefore, to talk of an independent measurement of that phenomenon. This means 44) **that/ what** within the supposedly objective, hard science of physics, it 45) **accepted/ is accepted** that reality and how it is measured form an inseparable whole.

04

Why are certain languages mistakenly thought to be primitive? There are several reasons. Some people 46) **consider/ considering** other languages ugly or "primitive sounding" if those languages make use of sounds or sound combinations they find unclear 47) **because/ because of** the sounds are greatly different from those of the languages they themselves speak. Such a view is based on the ethnocentric 48) **attitude/ altitude** that the characteristics of one's own language are obviously 49) **superior/ inferior**. But words that seem unpronounceable to speakers of one language — and are therefore considered obscure or even grotesque — are easily acquired by even the youngest native speakers of the language 50) **which/ in which** they occur. To a native speaker of English, the Czech word scvrnkls "you flicked off (something) with your finger" looks quite strange, and 51) **its/ it's** pronunciation may sound odd and even impossible 52) **because/ because of** there is no vowel among the eight consonants; for native speakers of Czech, of course, scvrnkls is just another word. Which speech sounds 53) **used/ are used** and how they are combined to form words and utterances vary from one language to the next, and speakers of no language can claim 54) **that/ what** their language 55) **has been done/ has done** the selecting and combining better than another.

Everywhere we turn we hear about almighty "cyberspace"! The hype promises that we will leave our boring lives, put on goggles and body suits, and enter some metallic, three-dimensional, multimedia other world. When the Industrial Revolution arrived with its great innovation, the motor, we didn't leave our world to go to some remote motorspace!

(A) These innovations led to a major socioeconomic movement precisely because they entered and affected profoundly our everyday lives. People have not changed fundamentally in thousands of years. Technology changes constantly. It's the one that must adapt to us.

(B) That's exactly what will happen with information technology and its devices under human-centric computing. The longer we continue to believe that computers will take us to a magical new world, the longer we will delay their natural fusion with our lives, the hallmark of every major movement that aspires to be called a socioeconomic revolution.

(C) On the contrary, we brought the motors into our lives, as automobiles, refrigerators, drill presses, and pencil sharpeners. This absorption has been so complete that we refer to all these tools with names that declare their usage, not their "motorness."

On April 12, 1955, the day that the US government announced that the new polio vaccine was safe and effective, its inventor, Jonas Salk, was asked on television who owned the vaccine.

(A) He could have earned $7 billion if his vaccine had been patented. His attitude to patenting, however, is not unique. Even in the era of excessive property protection, there is a new interest in open sources and access, global goods, and the notion of the commons.

(B) Elon Musk, CEO of Tesla Motors, decided in June 2014 to release all of his patents. Technological leadership is not defined by patents. The future of sustainable transport will be better served by openly sharing information and knowledge. "All our patents belong to you."

(C) He famously replied, "Well, the people, I would say. There is no patent. Could you patent the sun?" The vaccine was common property; it belonged to the people who had donated money for the public interest. Salk was later pitied for his decision.

By the early 1990s, the decline of the southwestern willow flycatcher was clear.

(A) For example, the process to list the flycatcher as endangered began in 1992, the proposed rule didn't come out until 1995, and it took until 1997 to produce the final ruling to list it. The FWS only completed the listing because the watchdog organization Center for Biological Diversity sued them.

(B) The FWS was highly politicized by powerful, moneyed interests that saw species listings and particularly habitat designations as a threat to business: if a species is listed but no critical habitat is designated, a now-common pattern, then restrictions on business are far fewer. This created an atmosphere in which it was extremely difficult for technical biological staff to maintain their integrity, says Marshall.

(C) In 1993, the U.S. Fish and Wildlife Service (FWS) formally proposed listing the flycatcher as a federal endangered species and designating critical habitat, an important step under the Endangered Species Act that prevents damage to specific areas. The task of writing the rule that listed the bird as endangered under the act fell to Rob Marshall. Marshall, a Yale-trained biologist with FWS in Arizona, was becoming disillusioned by the overall implementation of the Endangered Species Act.

These innovations led to a major socioeconomic movement precisely because they entered and affected profoundly our everyday lives. People have not changed fundamentally in thousands of years. Technology changes constantly. **우리에게 적응해야 하는 것은 바로 그것이다**. That's exactly what will happen with information technology and its devices under human-centric computing. The longer we continue to believe that computers will take us to a magical new world, the (C) **long/ longer** we will delay their natural fusion with our lives, the hallmark of every major movement that aspires to be called a socioeconomic revolution.

101) 윗글 주어진 문장을 문맥에 맞게 배열하시오.

us / adapt / to / must / the / It's / that / one

102) 다음, 어법상 틀린 것을 찾아 고치시오. [주관식]

On April 12, 1955, the day that the US government announced (A) **that/ what** the new polio vaccine was safe and effective, its inventor, Jonas Salk, was asked on television who owned the vaccine. He famously replied, "Well, the people, I would say. There is no patent. Could you patent the sun?" The vaccine was common property; it belonged to the people who (B) **had been donated/ had donated** money for the public interest. Salk was later pitied for his decision. **만약 그의 백신이 특허를 받았다면 그는 70억 달러를 벌 수 있었을 것이다**. His attitude to patenting, however, is not unique. Even in the era of excessive property protection, there is a new interest in open sources and access, global goods, and the notion of the commons. Elon Musk, CEO of Tesla Motors, decided in June 2014 (C) **to release/ releasing** all of his patents. Technological leadership is not defined by patents. The future of sustainable transport will be better served by openly sharing information and knowledge. "All our patents belong to you."

103) 주어진 한글에 맞도록 다음 빈칸들을 채우시오.

He c_____ _____ e_____ $7 billion if his v_____ _____ _____ p_____

02

By the early 1990s, the decline of the southwestern willow flycatcher was clear. In 1993, the U.S. Fish and Wildlife Service (FWS) formally proposed listing the flycatcher as a federal endangered species and designating critical habitat, an important step under the Endangered Species Act that (A) **preventing/ prevents** damage to specific areas. The task of writing the rule that listed the bird as endangered under the act fell to Rob Marshall. Marshall, a Yale-trained biologist with FWS in Arizona, was becoming disillusioned by the overall implementation of the Endangered Species Act. The FWS was highly politicized by powerful, moneyed interests that saw species listings and particularly habitat designations as a threat to business: if a species is listed but no critical habitat is designated, a now-common pattern, then restrictions on business are far fewer. This (B) **created/ was created** an atmosphere in which it was extremely difficult for technical biological staff to maintain their integrity, says Marshall. For example, the process to list the flycatcher as endangered began in 1992, the proposed rule didn't come out until 1995, and it took until 1997 to produce the final ruling to list it. The FWS only completed the listing (C) **because/ because of** the watchdog organization Center for Biological Diversity sued them.

Translating theory into something that can be assessed in the physical environment means that phenomena are made measurable. It is often assumed (A) **that/ what** the phenomenon being measured is the same no matter how it is measured. Translations of theory into practice may differ, but these do not alter the nature of the phenomenon being measured. _____ this assumption, measurement between different individuals made in different places or at different times could not be compared. The assumption does not, however, mean that this viewpoint is correct. Within quantum physics there is a view that the observer and the phenomenon cannot be separated. The observer and phenomenon make up a single system, a measurement system. In this context it is not possible to separate the measurement made from the measurement system (B) **which/ within which** it was made. The measurement and the phenomenon become combined in an unbreakable link in the measurement system. It is impossible to talk of a separate existence for the phenomenon and so also, therefore, to talk of an independent measurement of that phenomenon. This means that within the supposedly objective, hard science of physics, it is accepted that reality and (C) **what/ how** it is measured form an inseparable whole.

106) 위 빈칸에 들어갈 수 있는 **모든** 표현을 쓰시오.

Why are certain languages mistakenly thought to be primitive? There are several reasons. Some people consider other languages ugly or "primitive sounding" if those languages make use of sounds or sound combinations they find unclear because the sounds are greatly different from those of the languages they themselves speak. Such a view is based on the ethnocentric attitude (A) **that/ what** the characteristics of one's own language are obviously superior. But words that seem unpronounceable to speakers of one language — and are therefore considered obscure or even grotesque — are easily acquired by even the youngest native speakers of the language in which they occur. To a native speaker of English, the Czech word scvrnkls "you flicked off (something) with your finger" looks quite (B) **strange/ strangely**, and its pronunciation may sound odd and even impossible because there is no vowel among the eight consonants; for native speakers of Czech, of course, scvrnkls is just another word. Which speech sounds are used and how they are combined to form words and utterances (C) **vary/ various** from one language to the next, and speakers of no language can claim that their language has done the selecting and combining better than another.
