1. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?[1)]

When we are in groups, we tend to feel that we, personally, aren't as responsible as we would ① **be** if we were acting on our own. So the decisions that the group makes can easily become extreme. Occasionally, groups ② **reach** riskier decisions — they decide to take actions which are more challenging or unsafe than they should ③ **be**. Sometimes, though, they make choices that are too cautious. It's known as group polarization: a tendency towards extremes. A lot depends on how the discussions in the group ④ **develop**. If one person is advocating a risky strategy early on, others may begin to think of ⑤ **even** more challenging examples, and that leads the discussion towards ⑥ **reaching** a riskier decision. But if someone advocates more cautious approaches at an early stage, this too can influence the direction of the discussion, ⑦ **resulted in** a more cautious decision than the group members might have made ⑧ **individually**.

2. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?[2)]

Advertising in the United States ① **is** a relatively large and stable marketplace with a dollar volume of activity closely ② **tied** to the overall health of the economy. The same is true of ③ **other** mature industrialized nations, especially ④ **those** of Western Europe. One significant difference, however, is the way commercial media evolved. In the United States, radio and television systems began as commercial ventures; in many other countries media were largely or completely government ⑤ **supported** for years. Different models of commercial support ⑥ **are** still evolving and the precise configurations vary by country. This evolution does not mean, however, ⑦ **which** governments are uninvolved in steering the development of media. As Joseph Straubhaar observes, television systems are often "stubbornly national," ⑧ **which** means advertisers must tailor "global" media plans to the regulatory policies and cultural expectations of individual countries.

3. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?[3)]

Some people think that facts are the same as events, which they regard as the "objective," "hard core" elements of this universe. The main reason for thinking this is that events seem the best candidates ① **to offer** us a rock-solid foundation for our facts. True, events do happen or do not happen; you can neglect them but not deny them. So by replacing facts with events, we might think we have found the strong objective foundation ② **that** we strive for. However, facts and events are concepts very ③ **different from** each other. Unlike facts, events are dated, ④ **tied** to space and time, whereas facts ⑤ **are detached** from space and time. It is even ⑥ **considered** a fact that certain events did not occur; it is a fact, for instance, ⑦ **which** Darwin did not have a copy of Mendel's 1866 article in his collection. Apparently, a fact is not the same as an event; the best we can say ⑧ **is** that a fact is a description of an event, but not the event itself.

4. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?[4)]

The extent ① **to which** decision making is shared with subordinates or ② **concentrated** at the top of the hierarchy ③ **differ** across organizations. Thus, organizations can vary from strongly centralized decision-making practices to ④ **highly** participatory decision-making practices. In participatory decision making, subordinates have much more input into how decisions ⑤ **are made**. Research shows ⑥ **that** greater participation in decision making improves employees' satisfaction with the decisions, but does not necessarily translate into better group performance. Therefore, research has investigated when participatory decision making is most useful, and when it is less important. When the workers are highly ⑦ **educated**, intelligent, and have considerable expertise in their areas, participatory decision making is more effective. Additionally, when the task at hand is highly complex and knowledge about local conditions ⑧ **is** important to the decision, participatory decision making is important. Finally, in times of crisis, when the decisions have very strong impact, participatory decision making is useful.

5. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?[5)]

Insects attract collectors' attention because they are extremely diverse and often bear spectacular colors. To biologists, however, bright coloration has been a constantly renewed puzzle because it makes an insect a ① **highly** visible prey to prospective predators. Charles Darwin understood that bright colors or exaggerated forms could evolve via sexual selection, the process ② **by which** individuals compete for access to mates and fertilization opportunities. However, he felt sexual selection could not account for the striking color pattern of nonreproductive larvae in, for example, Pseudosphinx hawk moth caterpillars. In a reply to Darwin about this puzzle, Alfred R. Wallace proposed that bright colors could advertise the distastefulness of the caterpillars to experienced predators. Indeed, prey ③ **that** are not edible to predators ④ **are predicted** to gain by exhibiting very recognizable colors; experienced predators can then correctly identify and subsequently avoid ⑤ **attacking** such prey. E. B. Poulton later developed this idea, ⑥ **expanding** it to other warning signals (i.e., sounds or smells), and coined the term aposematism ⑦ **to describe** this phenomenon (from the Greek "away" and "sign").

6. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?[6)]

In ancient and medieval times considerable respect ① **was accorded** to language by those ② **working** in the scientific field. According to the ancient metaphysical Weltanschauung, it was believed that the structure of reality and of thought were so closely ③ **allied** that they were interchangeable. A logical statement — not only a matter of thinking but also of linguistics — ④ **were** automatically a true statement of reality. Since such a statement happened ⑤ **to be** true, it did not need ⑥ **subjecting** to experimental testing. However, in modern times it was realized for the first time that trust in the accord between reality and thinking ⑦ **was based** on a grossly exaggerated notion of the scope of human reason. In order to discover whether a logical statement (i.e. the logical language) was really true (i.e. agreed with reality), the statement should ⑧ **be tested** against empirical reality in an experiment. The emphasis on the physical experiment is characteristic of modern science. Later again it was realized that even this approach overrated the importance of thinking: from the outset research should ⑨ **be directed** by experiments, although that experimental action — like any action — ⑩ **required** the support of logical thought.

In ancient and medieval times ① **considerable respect** was accorded to language by those working in the scientific field. According to the ancient metaphysical Weltanschauung, it was believed that the structure of reality and of thought were so closely allied that they were interchangeable. A logical statement — not only a matter of thinking but also of linguistics — was automatically a ② **true** statement of reality. Since such a statement happened to be true, it did not need to be ③ **subjected** to experimental testing. However, in modern times it was realized for the first time that trust in the accord between reality and thinking was based on a grossly ④ **exaggerated** notion of the scope of human reason. In order to discover whether a logical statement (i.e. the logical language) was really true (i.e. agreed with reality), the statement should be tested against ⑤ **empirical reality** in an experiment. The emphasis on the ⑥ **physical experiment** is characteristic of modern science. Later again it was realized that even this approach ⑦ **underestimated** the importance of thinking: from the outset research should be directed by experiments, although that experimental action — like any action — required the ⑧ **support** of logical thought.

빈칸 추론

13. 다음 글의 빈칸에 들어갈 말로 가장 적절한 것은?[13]

When we are in groups, we tend to feel that we, personally, _____ as we would be if we were acting on our own. So the decisions that the group makes can easily become extreme. Occasionally, groups reach riskier decisions — they decide to take actions which are more challenging or unsafe than they should be. Sometimes, though, they make choices that are too cautious. It's known as group polarization: a tendency towards extremes. A lot depends on how the discussions in the group develop. If one person is advocating a risky strategy early on, others may begin to think of even more challenging examples, and that leads the discussion towards reaching a riskier decision. But if someone advocates more cautious approaches at an early stage, this too can influence the direction of the discussion, resulting in a more cautious decision than the group members might have made individually.

① are as realistic
② aren't as responsible
③ aren't as simplified
④ aren't as vivid
⑤ are as misunderstood

14. 다음 글의 빈칸에 들어갈 말로 가장 적절한 것은?[14]

Advertising in the United States is a relatively large and stable marketplace with a dollar volume of activity closely tied to the overall health of the economy. The same is true of other mature industrialized nations, especially those of Western Europe. One significant difference, however, is the way commercial media evolved. In the United States, radio and television systems began as commercial ventures; in many other countries media were largely or completely government supported for years. Different models of commercial support are still evolving and the precise configurations vary by country. This evolution does not mean, however, that governments _____. As Joseph Straubhaar observes, television systems are often "stubbornly national," which means advertisers must tailor "global" media plans to the regulatory policies and cultural expectations of individual countries.

① sacrifice moral values to avoid being held responsible for
② seek an uncontroversial cure-all solution to
③ follow the inevitable fate of becoming idealized in
④ come with prejudices when assessing the features of
⑤ are uninvolved in steering the development of media

15. 다음 글의 빈칸에 들어갈 말로 가장 적절한 것은?[15]

In ancient and medieval times considerable respect was accorded to language by those working in the scientific field. According to the ancient metaphysical Weltanschauung, it was believed that the structure of reality and of thought were so closely allied that they were interchangeable. A logical statement — not only a matter of thinking but also of linguistics — was automatically a true statement of reality. Since such a statement happened to be true, it did not need to be subjected to experimental testing. However, in modern times it was realized for the first time that trust in the accord between reality and thinking was based on a grossly exaggerated notion of the scope of human reason. In order to discover whether a logical statement (i.e. the logical language) was really true (i.e. agreed with reality), the statement should be tested against empirical reality in an experiment. The emphasis on the _____ is characteristic of modern science. Later again it was realized that even this approach overrated the importance of thinking: from the outset research should be directed by experiments, although that experimental action — like any action — required the support of logical thought.

① complex social hierarchy
② ecological diversity
③ physical experiment
④ parasitic relationship
⑤ effective reproduction process

16. 다음 글의 빈칸에 들어갈 말로 가장 적절한 것은?[16]

When we are in groups, we tend to feel that we, personally, aren't as responsible as we would be if we were acting on our own. So the decisions that the group makes can easily become extreme. Occasionally, groups reach riskier decisions — they decide to take actions which are more challenging or unsafe than they should be. Sometimes, though, they make choices that are too cautious. In ancient and medieval times considerable respect was accorded to language by those working in the scientific field. According to the ancient metaphysical Weltanschauung, it was believed that the structure of reality and of thought were so closely allied that they were interchangeable. A logical statement — not only a matter of thinking but also of linguistics — _____. Since such a statement happened to be true, it did not need to be subjected to experimental testing. However, in modern times it was realized for the first time that trust in the accord between reality and thinking was based on a grossly exaggerated notion of the scope of human reason. In order to discover whether a logical statement (i.e. the logical language) was really true (i.e. agreed with reality), the statement should be tested against empirical reality in an experiment. The emphasis on the physical experiment is characteristic of modern science. Later again it was realized that even this approach overrated the importance of thinking: from the outset research should be directed by experiments, although that experimental action — like any action — required the support of logical thought.

① was automatically a true statement of reality
② was accumulating and examining the locals' knowledge
③ went against the findings of our empirical research
④ relied on passengers' knowledge and experience
⑤ was inventing and rejecting successive hypotheses

When we are in groups, we tend to feel that we, personally, aren't as responsible as we would be if we were acting on our own. So the decisions that the group makes can easily become extreme. Occasionally, groups reach riskier decisions — they decide to take actions which are more challenging or unsafe than they should be. Sometimes, though, they make choices that are too cautious. It's known as group polarization: a tendency towards extremes. A lot _____. If one person is advocating a risky strategy early on, others may begin to think of even more challenging examples, and that leads the discussion towards reaching a riskier decision. But if someone advocates more cautious approaches at an early stage, this too can influence the direction of the discussion, resulting in a more cautious decision than the group members might have made individually.

① results in a negative outcome to the collective interest of all groups
② is compatible with the maximum benefit of each group
③ enhances unselfish interests of each and every commuter
④ is not well executed by the unexpected behaviors of some groups
⑤ depends on how the discussions in the group develop

Some people think that facts are the same as events, which they regard as the "objective," "hard core" elements of this universe. The main reason for thinking this is that events seem the best candidates to offer us a rock-solid foundation for our facts. True, events do happen or do not happen; you can neglect them but not deny them. So by replacing facts with events, we might think we have found the strong objective foundation that we strive for. However, facts and events are concepts very different from each other. Unlike facts, events are dated, tied to space and time, whereas facts are detached from space and time. It is even considered a fact that certain events did not occur; it is a fact, for instance, that Darwin did not have a copy of Mendel's 1866 article in his collection. Apparently, a fact is not the same as an event; the best we can say is that a fact _____.

① focuses on the why, belittling the what and the how
② liberates you from the prison of daily routines
③ is a description of an event, but not the event itself
④ paves your way to climb up the corporate ladder
⑤ illuminates the true value of what you have to do

In ancient and medieval times considerable respect was accorded to language by those working in the scientific field.

(A) The emphasis on the physical experiment is characteristic of modern science. Later again it was realized that even this approach overrated the importance of thinking: from the outset research should be directed by experiments, although that experimental action — like any action — required the support of logical thought.

(B) According to the ancient metaphysical Weltanschauung, it was believed that the structure of reality and of thought were so closely allied that they were interchangeable. A logical statement — not only a matter of thinking but also of linguistics — was automatically a true statement of reality. Since such a statement happened to be true, it did not need to be subjected to experimental testing.

(C) However, in modern times it was realized for the first time that trust in the accord between reality and thinking was based on a grossly exaggerated notion of the scope of human reason. In order to discover whether a logical statement (i.e. the logical language) was really true (i.e. agreed with reality), the statement should be tested against empirical reality in an experiment.

62. 다음 글의 네모 안에서 문법상 맞는 말로 가장 적절한 것은?[서술형][62]

When we are in groups, we tend **[to feel / feeling]** **[that / what]** we, personally, aren't as **[responsible / responsibly]** as we would **[be / have been]** if we were acting on our own. So the decisions **[that / what]** the group makes can easily become extreme. Occasionally, groups **[reach / reach to]** riskier decisions — they decide **[to take / taking]** actions which are more challenging or unsafe than they should **[be / have been]**. Sometimes, though, they make choices **[that / what]** are too cautious. It's known as group polarization: a tendency towards extremes. A lot depends on **[what / how]** the discussions in the group **[develop / are developed]**. If one person is advocating a risky strategy early on, others may begin to think of **[even / very]** more challenging examples, and that **[lead / leads]** the discussion towards **[reaching / reaching to]** a riskier decision. But if someone advocates more cautious approaches at an early stage, this too can influence the direction of the discussion, **[resulting / resulted]** **[in / from]** a more cautious decision than the group members might **[make / have made]** **[individual / individually]**.

63. 다음 글의 네모 안에서 문법상 맞는 말로 가장 적절한 것은?[서술형][63]

Advertising in the United States **[is / are]** a relatively large and stable marketplace with a dollar volume of activity closely **[tying / tied]** to the overall health of the economy. The same is true of **[another / other]** mature industrialized nations, especially **[that / those]** of Western Europe. One significant difference, however, is the way commercial media evolved. In the United States, radio and television systems began as commercial ventures; in many **[another / other]** countries media were largely or completely **[government supporting / government supported]** for years. Different models of commercial support **[is / are]** still evolving and the precise configurations vary by country. This evolution does not mean, however, **[that / what]** governments are uninvolved in steering the development of media. As Joseph Straubhaar observes, television systems are often "stubbornly national," **[which / it]** means advertisers must tailor "global" media plans to the regulatory policies and cultural expectations of individual countries.

64. 다음 글의 네모 안에서 문법상 맞는 말로 가장 적절한 것은?[서술형][64]

Some people think **[that / what]** facts are the same as events, which they regard as the "objective," "hard core" elements of this universe. The main reason for thinking this is **[that / what]** events seem the best candidates **[to offer / offering]** us a rock-solid foundation for our facts. True, events do happen or do not happen; you can neglect them but not deny them. So by replacing facts with events, we might think we have found the strong objective foundation **[that / what]** we strive for. However, facts and events are concepts very **[different / differently]** from each other. Unlike facts, events are dated, **[tying / tied]** to space and time, whereas facts **[detached / are detached]** from space and time. It is even **[considering / considered]** a fact **[that / what]** certain events did not occur; it is a fact, for instance, **[that / what]** Darwin did not have a copy of Mendel's 1866 article in his collection. Apparently, a fact is not the same as an event; the best we can say **[is / are]** **[that / what]** a fact is a description of an event, but not the event itself.

65. 다음 글의 네모 안에서 문법상 맞는 말로 가장 적절한 것은?[서술형][65]

The extent **[which / to which]** decision making is shared with subordinates or **[concentrating / concentrated]** at the top of the hierarchy **[differs]** across organizations. Thus, organizations can vary from strongly centralized decision-making practices to **[high / highly]** participatory decision-making practices. In participatory decision making, subordinates have much more input into how decisions **[make / are made]**. Research shows **[that / what]** greater participation in decision making improves employees' satisfaction with the decisions, but does not necessarily translate into better group performance. Therefore, research has investigated when participatory decision making is most useful, and when it is less important. When the workers are **[high / highly]** **[educating / educated]**, intelligent, and have considerable expertise in their areas, participatory decision making is more effective. Additionally, when the task at hand is **[high / highly]** complex and knowledge about local conditions **[is / are]** important to the decision, participatory decision making is important. Finally, in times of crisis, when the decisions have very strong impact, participatory decision making is useful.

66. 다음 글의 네모 안에서 문법상 맞는 말로 가장 적절한 것은?[서술형][66]

Insects attract collectors' attention because they are extremely diverse and often bear spectacular colors. To biologists, however, bright coloration has been a constantly **[renewing / renewed]** puzzle because it makes an insect a **[high / highly]** visible prey to prospective predators. Charles Darwin understood **[that / what]** bright colors or exaggerated forms could evolve via sexual selection, the process **[which / by which]** individuals compete for access to mates and fertilization opportunities. However, he felt sexual selection could not account for the striking color pattern of nonreproductive larvae in, for example, Pseudosphinx hawk moth caterpillars. In a reply to Darwin about this puzzle, Alfred R. Wallace proposed **[that / what]** bright colors could advertise the distastefulness of the caterpillars to experienced predators. Indeed, prey **[that / what]** **[is / are]** not edible to predators **[predicte / are predicted]** to gain by exhibiting very recognizable colors; experienced predators can then correctly identify and subsequently avoid **[to attack / attacking]** such prey. E. B. Poulton later developed this idea, **[expanding / expanded]** it to other warning signals (i.e., sounds or smells), and coined the term aposematism **[to describe / described]** this phenomenon (from the Greek "away" and "sign").

67. 다음 글의 네모 안에서 문법상 맞는 말로 가장 적절한 것은?[서술형][67]

In ancient and medieval times considerable respect **[accorded / was accorded]** to language by those **[working / worked]** in the scientific field. According to the ancient metaphysical Weltanschauung, it was believed **[that / what]** the structure of reality and of thought were so closely **[allying / allied]** **[that / what]** they were interchangeable. A logical statement — not only a matter of thinking but also of linguistics — **[was / were]** automatically a true statement of reality. Since such a statement happened **[to be / being]** true, it did not need to **[subject / be subjected]** to experimental testing. However, in modern times it was realized for the first time **[that / what]** trust in the accord between reality and thinking **[based / was based]** on a grossly exaggerated notion of the scope of human reason. In order to discover whether a logical statement (i.e. the logical language) was really true (i.e. agreed with reality), the statement should **[teste / be tested]** against empirical reality in an experiment. The emphasis on the physical experiment is characteristic of modern science. Later again it was realized **[that / what]** even this approach overrated the importance of thinking: from the outset research should **[direct / be directed]** by experiments, **[although / despite]** that experimental action — like any action — **[requiring / required]** the support of logical thought.

170. 다음 빈칸에 들어갈 말을 주어진 〈조건〉에 맞게 영어로 쓰시오.[170]

When we are in groups, we tend to feel that we, personally, aren't as responsible as we would be if we were acting on our own. So the decisions that the group makes can easily become extreme. Occasionally, groups reach riskier decisions — they decide to take actions which are more challenging or unsafe than they should be. Sometimes, though, they make choices that are too cautious. It's known as group polarization: a tendency towards extremes. _____. If one person is advocating a risky strategy early on, others may begin to think of even more challenging examples, and that leads the discussion towards reaching a riskier decision. But if someone advocates more cautious approaches at an early stage, this too can influence the direction of the discussion, resulting in a more cautious decision than the group members might have made individually.

Advertising in the United States is a relatively large and stable marketplace with a dollar volume of activity closely tied to the overall health of the economy. The same is true of other mature industrialized nations, especially those of Western Europe. One significant difference, however, is the way commercial media evolved. In the United States, radio and television systems began as commercial ventures; in many other countries media were largely or completely government supported for years. Different models of commercial support are still evolving and the precise configurations vary by country. This evolution does not mean, however, that governments _____. As Joseph Straubhaar observes, television systems are often "stubbornly national," which means advertisers must tailor "global" media plans to the regulatory policies and cultural expectations of individual countries.

172. 다음 빈칸에 들어갈 말을 주어진 〈조건〉에 맞게 영어로 쓰시오.[172]

Some people think that facts are the same as events, which they regard as the "objective," "hard core" elements of this universe. The main reason for thinking this is that events seem the best candidates to offer us a rock-solid foundation for our facts. True, events do happen or do not happen; you can neglect them but not deny them. So by replacing facts with events, we might think we have found the strong objective foundation that we strive for. However, facts and events are concepts very different from each other. Unlike facts, events are dated, tied to space and time, whereas facts are detached from space and time. It is even considered a fact that certain events did not occur; it is a fact, for instance, that Darwin did not have a copy of Mendel's 1866 article in his collection. Apparently, a fact is not the same as an event; the best we can say is that a fact _____.

The extent to which decision making is shared with subordinates or concentrated at the top of the hierarchy differs across organizations. Thus, organizations can vary from strongly centralized decision-making practices to highly participatory decision-making practices. In participatory decision making, subordinates have much more input into how decisions are made. Research shows that greater participation in decision making improves employees' satisfaction with the decisions, but _____. Therefore, research has investigated when participatory decision making is most useful, and when it is less important. When the workers are highly educated, intelligent, and have considerable expertise in their areas, participatory decision making is more effective. Additionally, when the task at hand is highly complex and knowledge about local conditions is important to the decision, participatory decision making is important. Finally, in times of crisis, when the decisions have very strong impact, participatory decision making is useful.

174. 다음 빈칸에 들어갈 말을 주어진 〈조건〉에 맞게 영어로 쓰시오.[174]

Insects attract collectors' attention because they are extremely diverse and often bear spectacular colors. To biologists, however, bright coloration has been a constantly renewed puzzle because it makes an insect a highly visible prey to prospective predators. Charles Darwin understood that bright colors or exaggerated forms could evolve via sexual selection, the process by which individuals compete for access to mates and fertilization opportunities. However, he felt sexual selection could not account for the striking color pattern of nonreproductive larvae in, for example, Pseudosphinx hawk moth caterpillars. In a reply to Darwin about this puzzle, Alfred R. Wallace proposed that bright colors could _____. Indeed, prey that are not edible to predators are predicted to gain by exhibiting very recognizable colors; experienced predators can then correctly identify and subsequently avoid attacking such prey. E. B. Poulton later developed this idea, expanded it to other warning signals (i.e., sounds or smells), and coined the term aposematism to describe this phenomenon (from the Greek "away" and "sign").

175. 다음 빈칸에 들어갈 말을 주어진 〈조건〉에 맞게 영어로 쓰시오.[175]

In ancient and medieval times considerable respect was accorded to language by those working in the scientific field. According to the ancient metaphysical Weltanschauung, it was believed that the structure of reality and of thought were so closely allied that they were interchangeable. A logical statement — not only a matter of thinking but also of linguistics — was automatically a true statement of reality. Since such a statement happened to be true, it did not need to be subjected to experimental testing. However, in modern times it was realized for the first time that trust in the accord between reality and thinking _____. In order to discover whether a logical statement (i.e. the logical language) was really true (i.e. agreed with reality), the statement should be tested against empirical reality in an experiment. The emphasis on the physical experiment is characteristic of modern science. Later again it was realized that even this approach overrated the importance of thinking: from the outset research should be directed by experiments, although that experimental action — like any action — required the support of logical thought.
