1. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?[1)]

There are several theories about why older people experience "long-term" time compression so much more ① **acutely** than young people. It has been observed, for example, ② **that** for a twenty-year-old, ten years ③ **is** half a lifetime, but for a fifty-year-old, the same span represents just 20 percent of one's life. As we age, a decade becomes an ever-smaller proportion of our life experience. Others have emphasized the fact ④ **that**, in a ten-year span, younger people encounter more "turning points" than older people. In just ten years, a younger person is likely ⑤ **to graduate** from college, woo and win a mate, start a family, and buy a house. Older people, in contrast, can easily pass a decade ⑥ **doing** the same job and ⑦ **live** in the same house with the same spouse. The absence of frequent life-changing events may partly explain why older people feel that the later decades seem ⑧ **to pass** so quickly.

2. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?[2)]

Social mobility is upward or downward movement in social position over time in a society. That movement can be specific to individuals who change social positions or to categories of people, such as racial or ethnic groups. Social mobility between generations ① **is referred** to as intergenerational mobility. The self-made myth suggests ② **that** social position in the United States is largely up to the individual, ③ **implying** that mobility is quite common and easy to achieve for those who apply ④ **them**. However, what people believe and what is fact ⑤ **are** often not the same. A recent experimental study found that Americans substantially and consistently ⑥ **overestimate** the amount of income mobility and educational access in society. The higher one's social class, ⑦ **the more** likely they are to overestimate social mobility. In other words, wealthy Americans tend ⑧ **to subscribe** to the belief ⑨ **that** pulling oneself out of poverty is easier than it actually ⑩ **is** and that one's wealth is a result of hard work and initiative, rather than luck or birth.

3. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?[3)]

In Ancient Greece, many private individuals believed in the powers of magic, such as farmers who were always dependent on the weather. Even though the use of magic was widespread in Ancient Greece, ① **there** remained an official caution over its use. We know that the Greek authorities believed ② **that** magic was an activity capable of results, but they grew ③ **concerned** about those who practiced harmful magic. So it was established that those who practiced harmful magic could ④ **be punished** by civic action. This may be the reason why magic in the classical world ⑤ **was held** in low esteem and ⑥ **condemned** by speakers and writers. Likewise, we find certain intellectuals ⑦ **realizing** that the power of magic could ⑧ **be abused**. For example, Plato believed that those who sold spells and curse tablets should ⑨ **be punished**. Epicurean and Stoic philosophers also believed that magic should ⑩ **be eliminated**. This mistrust of magic, along with religion and a separation of humans from the divine world, ⑪ **creating** a need to develop new methods of understanding the world. It is thus understandable that the Ancient Greeks created the foundations for philosophy.

4. 다음 글의 밑줄 친 부분 중, 어법상 틀린 것은?[4)]

The development psychologist Jerome Kagan measured changes in children's temperament between the ages of 4 months and 7 years. He classified several healthy 4-month-old infants as high reactors (easily ① **excited** or fearful) or low reactors (② **relaxed** and unafraid), ③ **depending** upon their responses to an unfamiliar stimulus. Kagan waved colorful mobiles in front of a baby, played a tape saying, "Hello baby, how are you doing today?" and popped a balloon behind the baby's head. High reactors moved around violently and cried, while low reactors ④ **rested** or even laughed during the tests. By the time these infants were 4 years old, some of the high reactors were quite shy, ⑤ **subduing**, and quiet, while others had moved toward the center of Kagan's "shy-bold" continuum. By the age of 7, only 15 percent of the initially low reactors were enthusiastic, fearless, and ⑥ **highly** sociable kids, and the rest had moved closer to the center. None of the high reactors became fearless, and none of the low reactors became fearful; in other words, environment only moderately affected the final outcome.

However, what people believe and what is fact are often not the same.

Social mobility is upward or downward movement in social position over time in a society. That movement can be specific to individuals who change social positions or to categories of people, such as racial or ethnic groups. ① Social mobility between generations is referred to as intergenerational mobility. ② The self-made myth suggests that social position in the United States is largely up to the individual, implying that mobility is quite common and easy to achieve for those who apply themselves. ③ A recent experimental study found that Americans substantially and consistently overestimate the amount of income mobility and educational access in society. ④ The higher one's social class, the more likely they are to overestimate social mobility. ⑤ In other words, wealthy Americans tend to subscribe to the belief that pulling oneself out of poverty is easier than it actually is and that one's wealth is a result of hard work and initiative, rather than luck or birth.

Likewise, we find certain intellectuals realizing that the power of magic could be abused.

In Ancient Greece, many private individuals believed in the powers of magic, such as farmers who were always dependent on the weather. Even though the use of magic was widespread in Ancient Greece, there remained an official caution over its use. We know that the Greek authorities believed that magic was an activity capable of results, but they grew concerned about those who practiced harmful magic. So it was established that those who practiced harmful magic could be punished by civic action. ① This may be the reason why magic in the classical world was held in low esteem and condemned by speakers and writers. ② For example, Plato believed that those who sold spells and curse tablets should be punished. ③ Epicurean and Stoic philosophers also believed that magic should be eliminated. ④ This mistrust of magic, along with religion and a separation of humans from the divine world, created a need to develop new methods of understanding the world. ⑤ It is thus understandable that the Ancient Greeks created the foundations for philosophy.

By the time these infants were 4 years old, some of the high reactors were quite shy, subdued, and quiet, while others had moved toward the center of Kagan's "shy-bold" continuum.

The development psychologist Jerome Kagan measured changes in children's temperament between the ages of 4 months and 7 years. He classified several healthy 4-month-old infants as high reactors (easily excited or fearful) or low reactors (relaxed and unafraid), depending upon their responses to an unfamiliar stimulus. ① Kagan waved colorful mobiles in front of a baby, played a tape saying, "Hello baby, how are you doing today?" and popped a balloon behind the baby's head. ② High reactors moved around violently and cried, while low reactors rested or even laughed during the tests. ③ By the age of 7, only 15 percent of the initially low reactors were enthusiastic, fearless, and highly sociable kids, and the rest had moved closer to the center. ④ None of the high reactors became fearless, and none of the low reactors became fearful; in other words, environment only moderately affected the final outcome. ⑤

There are several theories about why older people experience "long-term" time compression so much more acutely than young people. ① It has been observed, for example, that for a twenty-year-old, ten years is half a lifetime, but for a fifty-year-old, the same span represents just 20 percent of one's life. ② As we age, a decade becomes an ever-smaller proportion of our life experience. ③ Others have emphasized the fact that, in a ten-year span, younger people encounter more "turning points" than older people. ④ Aggression, an act of hostility by one person toward another, is something that is seen everywhere. ⑤ In just ten years, a younger person is likely to graduate from college, woo and win a mate, start a family, and buy a house. Older people, in contrast, can easily pass a decade doing the same job and living in the same house with the same spouse. The absence of frequent life-changing events may partly explain why older people feel that the later decades seem to pass so quickly.

The development psychologist Jerome Kagan measured changes in children's **(A)**_____ between the ages of 4 months and 7 years. He **(B)**_____ several healthy 4-month-old infants as high reactors (easily excited or fearful) or low reactors (relaxed and unafraid), depending upon their responses to a(n) **(C)**_____ stimulus. Kagan waved colorful mobiles in front of a baby, played a tape saying, "Hello baby, how are you doing today?" and popped a balloon behind the baby's head. High reactors moved around **(D)**_____ and cried, **(E)while** low reactors rested or even laughed during the tests. By the time these infants were 4 years old, some of the high reactors were quite shy, **(F)**_____, and quiet, while others had moved toward the center of Kagan's **(G)**_____. By the age of 7, only 15 percent of the initially low reactors were enthusiastic, fearless, and highly **(H)**_____ kids, and the rest had moved closer to the center. None of the high reactors became **(I)**_____, and none of the low reactors became **(J)**_____; in other words, **(K)**_____ only moderately affected the **(L)**_____.

There are several theories about _____ than young people. It has been observed, for example, that for a twenty-year-old, ten years is half a lifetime, but for a fifty-year-old, the same span represents just 20 percent of one's life. As we age, a decade becomes an ever-smaller proportion of our life experience. Others have emphasized the fact that, in a ten-year span, younger people encounter more "turning points" than older people. In just ten years, a younger person is likely to graduate from college, woo and win a mate, start a family, and buy a house. Older people, in contrast, can easily pass a decade doing the same job and living in the same house with the same spouse. The absence of frequent life-changing events may partly explain why older people feel that the later decades seem to pass so quickly.

Social mobility is upward or downward movement in social position over time in a society. That movement can be specific to individuals who change social positions or to categories of people, such as racial or ethnic groups. Social mobility between generations is referred to as intergenerational mobility. The self-made myth suggests that social position in the United States is largely up to the individual, implying that mobility is quite common and easy to achieve for those who apply themselves. However, _____. A recent experimental study found that Americans substantially and consistently overestimate the amount of income mobility and educational access in society. The higher one's social class, the more likely they are to overestimate social mobility. In other words, wealthy Americans tend to subscribe to the belief that pulling oneself out of poverty is easier than it actually is and that one's wealth is a result of hard work and initiative, rather than luck or birth.

122. 다음 빈칸에 들어갈 말을 주어진 〈조건〉에 맞게 영어로 쓰시오.[122]

In Ancient Greece, many private individuals believed in the powers of magic, such as farmers who were always dependent on the weather. Even though the use of magic was widespread in Ancient Greece, there remained an official caution over its use. We know that the Greek authorities believed that magic was an activity capable of results, but they grew concerned about those who practiced harmful magic. So it was established that those who practiced harmful magic could be punished by civic action. This may be the reason why magic in the classical world was held in low esteem and condemned by speakers and writers. Likewise, we find certain intellectuals realizing that the power of magic could be abused. For example, Plato believed that those who sold spells and curse tablets should be punished. Epicurean and Stoic philosophers also believed that magic should be eliminated. This mistrust of magic, along with religion and a separation of humans from the divine world, created a need to develop new methods of understanding the world. It is thus understandable that _____.

123. 다음 빈칸에 들어갈 말을 주어진 〈조건〉에 맞게 영어로 쓰시오.[123]

The development psychologist Jerome Kagan measured changes in children's temperament between the ages of 4 months and 7 years. He classified several healthy 4-month-old infants as high reactors (easily excited or fearful) or low reactors (relaxed and unafraid), depending upon their responses to an unfamiliar stimulus. Kagan waved colorful mobiles in front of a baby, played a tape saying, "Hello baby, how are you doing today?" and popped a balloon behind the baby's head. High reactors moved around violently and cried, while low reactors rested or even laughed during the tests. By the time these infants were 4 years old, some of the high reactors were quite shy, subdued, and quiet, while others had moved toward the center of Kagan's "shy-bold" continuum. By the age of 7, only 15 percent of the initially low reactors were enthusiastic, fearless, and highly sociable kids, and the rest had moved closer to the center. None of the high reactors became fearless, and none of the low reactors became fearful; in other words, _____.

44) [excited] [relaxed] [depending] [played] [rested] [subdued] [highly]
45) long-term
46) time compression
47) acutely
48) 20세에게는 10년이 반평생이지만, 50세에게는 같은 기간이 자기 인생의 단지 20 퍼센트에 해당한다
49) ever-smaller
50) ②
51) more
52) turning points
53) absence
54) quickly
55) Why Older People Experience Time Compression
56) observe
57) 고령자들은 인생의 중대한 사건의 발생이 드물기 때문에 시간 압축을 더 강렬하게 경험한다
58) Social mobility
59) specific
60) Social mobility
61) is referred
62) intergenerational mobility
63) self-made
64) individual
65) implying
66) achieve
67) do hard work
68) 사회적 지위가 개인에 달려있다
69) are
70) overestimate
71) higher
72) the more
73) overestimate
74) subscribe
75) ②
76) pulling oneself out of poverty is easier than it actually is
77) hard work and initiative
78) luck or birth
79) Americans' unfounded belief in social mobility
80) initiative
81) 미국인들은 사회 이동은 개인에 달려있다는 근거 없는 믿음을 갖는 경향이 있다
82) dependent on
83) widespread
84) official caution
85) capable
86) concerned
87) 해로운 마법을 행하는 사람들은 시민 행동에 의해 처벌될 수도 있다
88) was established
89) punished
90) 해로운 마법을 행하는 사람들은 시민 행동에 의해 처벌될 수도 있다고 정해졌던 것
91) for which
92) was held
93) condemned

94) realizing
95) be abused
96) punished
97) eliminated
98) mistrust
99) sacred
100) created
101) It is understandable that the Ancient Greeks created the foundations for philosophy
102) a negative perception of ancient Greek magic
103) abuse
104) 고대 그리스에서 마법에 대한 불신이 철학의 출현을 촉발시켰다
105) temperament
106) classified
107) unfamiliar
108) violently
109) ⑤
110) subdued
111) shy-bold continuum
112) sociable
113) fearless
114) fearful
115) environment
116) final outcome
117) temperament of children who are unaffected by the environment in infancy
118) temperament
119) 아이들의 기질적 특성은 유아기에 환경에 크게 영향을 받지 않는다
120) why older people experience "long-term" time compression so much more acutely
121) what people believe and what is fact are often not the same
122) the Ancient Greeks created the foundations for philosophy
123) environment only moderately affected the final outcome
124) ③ more
125) ⑥ higher
126) ⑫ philosophy
127) ④ violently
128) ①
129) ⑤
