I am a loyal subscriber of your magazine and have been for over three years now and have always enjoyed the articles that you write about. I was really ① **excited** when I realized that you were going to do a piece on the charitable organization Open Heart Orphanage Ministry, which is very close to my heart. I was, however, a little bit ② **disappointed** when I read the article and realized that there were several mistakes in it, especially with regard to the history of the group. I feel ③ **that** a publication's reputation rests greatly on its ability to provide factual information and, therefore, feel ④ **moving** to send you corrections that you can use. Moreover, I want to maintain the integrity of the history of the Open Heart Orphanage Ministry ⑤ **that** has done a lot to improve the lives of numerous children in Africa. Thank you and I hope to see a ⑥ **printed** correction in your next issue.

Ms. Carter was a teacher who everyone said ① **was** so hard in her grading. She kept ② **telling** us in class that she was willing to go over our papers beforehand with us during her office hours. At the time I thought, "Well, I don't think I'll go to your office and have you chop up my paper." Then I tried to actually write the paper over the weekend, but I found that I was clueless. I hesitantly decided that I would swallow my pride and ③ **go** to her with my first draft. Contrary to my expectation, when I sat down with her, she was actually really ④ **encouraging** about it. She looked over my entire paper quickly, then ⑤ **sat and discussed** with me my strong ideas and areas ⑥ **where** needed more work. She even helped me with the format so I wouldn't get ⑦ **docked** points on that. Though it took a lot of courage and guts for me ⑧ **to enter** that office, I'm so glad I ⑨ **did**.

Tech eats into sleep time. It doesn't matter if your screen is pumping out a restful, warm light and you're looking at soothing images. If you don't nod off because you're too busy ① **looking** at screens, your sleep will suffer. I'm sure we've all been aimlessly scrolling or working on something or checking social networking services in an endless loop, but ② **knowing** it's about time we got some sleep yet still can't seem ③ **to stop**. A straightforward way of addressing this problem is to set a sleep alarm. You set an alarm for the morning, so set ④ **another** for the evening too. This is when you have to switch off (in every sense of the word) and start getting ready for bed. You can't ignore your morning alarm if you want to keep your job, so the one you set for the evening has to become immovable too. You could swipe-proof your night-time sleep alarm by changing the settings on your smartphone ⑤ **to ban** apps after a particular time. That way, you're more likely ⑥ **to focus** on sleep, not apps.

Don't believe anyone who says that since nature ① **is based** on a struggle for life, we need to live like this as well. Many animals survive not by eliminating each other or keeping everything for ② **themselves**, but by cooperating and sharing. This applies most definitely to pack hunters, such as wolves or killer whales, but it also applies to our closest relatives, the primates. In a study ③ **done** at Taï National Park, in Ivory Coast, chimpanzees took care of group mates ④ **wounded** by leopards; they licked their mates' blood, carefully ⑤ **removed** dirt, and waved away flies that came near the wounds. They protected injured companions and slowed down during travel in order to accommodate them. All of this makes perfect sense, ⑥ **given** that chimpanzees live in groups for a reason, the same way wolves and humans are group animals for a reason. If man is wolf to man, he is so in every sense, not just the negative one. We would not ⑦ **have been** where we are today ⑧ **had our ancestors** been socially aloof.

The physical environment directly determines the capacity for independent living of anyone with a difficulty or disability (difficulty walking, poor sight, ① **impaired** hearing, etc.). The idea is to encourage independent living through careful attention to architectural and urban design and services. In buildings, the absence of lifts or ramps can make life ② **impossible** for the elderly. The design of interior traffic and services areas can do the same. Outdoors, the absence of public benches, footpaths that are too narrow or too ③ **high**, a road that is dangerous to cross, the difficulty or impossibility of boarding a bus or tram can force someone with impaired mobility ④ **to curtail** their activities, or ⑤ **to stay** at home. Bad design turns disabilities into handicaps. Poor design can ⑥ **be exacerbated** by the "rudeness, insecurity and violence" that can be attendant on going outdoors. If these issues are not ⑦ **dealing** with, a vicious circle of dependence develops.

While the term "ecosystem management" began appearing ever more frequently in scientific journals and government reports, it seemed that no two people could agree on ① **what** it meant, as definitions of ecosystem management and practitioners or advocates of its use ② **to occur** in roughly equal numbers. So it seems ③ **strange** that ④ **nearly** everyone agreed that ecosystem management was a good thing. When ecosystem management became part of the process of deciding how to use public land, both the environmental community and ⑤ **those concerned** with maintaining resource flows took a keen interest in defining ecosystem management in their own terms. Indeed, one observer suggested ⑥ **that** when environmental groups heard the term "ecosystem management" they mainly heard "ecosystem," while industry groups heard "management." This led to the ⑦ **unsettling** phenomenon of resource management agencies, conservationists, and industry representatives, who generally couldn't agree on what time it was, ⑧ **singing** in unison the praises of ecosystem management at congressional hearings in the early 1990s.

Namibian communities have been receiving nearly $10 million a year from wildlife, says Fred Nelson, a wildlife expert who spent 11 years in Africa ① **developing** wildlife management partnerships. Since the revenues come primarily from trophy hunting and tourism ventures, local communities had a strong incentive ② **to protect** the animals and their habitat. These new incentives led to a natural resurgence in wildlife numbers. Even the number of black rhinos in Namibia ③ **rose** from 707 in 1997 to 1,134 in 2004. Clearly, property rights to ownership or use and freedom to trade ④ **are** among the keys to conservation. These incentives can encourage protection, care, and increased numbers, just as they ⑤ **are** with cattle. Indeed, after legal action by private rhino holders, a judge in South Africa lifted the ban on domestic trade in rhino horn. Trade will give those farmers and communities that own rhinos an incentive to protect them. But where ownership and trade ⑥ **are prohibited**, the protection will be ⑦ **missing** and poaching will probably continue.

Unfortunately, unemployment programs have an unintended secondary effect: They increase the unemployment rate. The benefits make ① **it** less costly for an unemployed worker ② **to turn** down available jobs and continue searching ③ **while receiving** the payments. They also reduce the incentive of the unemployed to switch occupations or move to ④ **another** location in order to find employment. As a result, workers stay ⑤ **unemployed** longer and the overall unemployment rate is higher than it would ⑥ **be** otherwise. In fact, empirical evidence indicates that there is a spike in the number of unemployed workers ⑦ **obtaining** employment just before and immediately after their unemployment benefits ⑧ **are exhausted**. The persistently higher unemployment rates in Europe, ⑨ **where** the benefits are more generous, also ⑩ **indicating** that the program pushes the unemployment rate upward, perhaps by as much as 2 or 3 percentage points.

The sense of familial and cultural solidarity that comes with feasting can be very pleasant and ① **reassuring**, rewarding in ways both nutritional and psychological. Eating to 120 percent full is probably a pretty standard performance at a feast, so over the course of a million-plus years of feasting, a strong psychological association likely ② **evolved** between being extra full and a sense of social well-being. The importance of social life to human beings cannot ③ **be underestimated**. The common ancestor we shared with chimpanzees millions of years ago ④ **was** likely a highly social species, just as chimpanzees and we ⑤ **do** today. Over the course of our evolution, humans gained a tool — language — that has helped our kind ⑥ **to ratchet** up all aspects of social life. Sharing food both on a day-to-day basis and on special occasions ⑦ **is** part of the complex of behaviors that now defines how humans are social. In a less profound or obvious way, occasional overeating may also be part of this complex.

There are a number of ways our selfish behaviour can ① **be moderated**, especially when attention ② **is drawn** to us. For example, simply looking in a mirror forces adults literally ③ **to self-reflect**, which studies have shown ④ **to reduce** cheating on a test. This effect of mirrored self-focus on morality is consistent with recent studies ⑤ **demonstrating** that merely hanging up posters of staring human eyes doubled the number of diners that cleaned up after ⑥ **themselves** after they ⑦ **had finished** their meals. When we think we are ⑧ **being watched**, we tend to behave ourselves. If the fear of exposure regulates our transgressions, then religions with an all-seeing God may operate to foster moral behaviour precisely because followers think that they ⑨ **are constantly observed**. Most of the world's religions promote prosociality in their teachings and practices. There is a common assumption ⑩ **that** religions foster kindness and generosity, as ⑪ **epitomized** by the parable of the Good Samaritan in Christianity.

Consider the old saying "A little learning is a dangerous thing." As individuals, we are quick ① **to access** information that helps us. But we often lack the ability to make sense of it, or to use it appropriately. One of us ② **has** a brother who is a medical doctor. He encounters this problem on a daily basis (and we might add, he is not too happy about it). Patients show up with (often incorrect) self-diagnoses ③ **deriving** from spending a couple of hours on the Internet. It is the same in business: senior executives second-guess their subordinates because their corporate IT system gives ④ **them** line of sight down to detailed plant-level data. At a societal level, people believe they have the right to information that is in the public interest (think Wikileaks), but they are rarely capable of interpreting and ⑤ **using** it in a sensible way.

Many economic laws ① **have been criticized** as having only statistical necessity. Consider the law ② **stating** that the quantity ③ **sold** varies inversely with its price. We can show that it is not universally true with a thought experiment ④ **featuring** an isolated village of peasants. The villagers can subsist on a weekly ration of one pound of rice and two pounds of beans or can subsist on the tastier and more nutritious fare of one pound of rice, one pound of beans, and one pound of fish. Rice and beans each ⑤ **cost** $1.00 per pound, but a pound of fish ⑥ **costs** $1.20. Since the peasants ⑦ **pay** $3.20 a week, they spend it all on the rice, beans, and fish diet. What happens if the price of beans rises to $1.10? (It is impossible to buy less than a pound of anything.) Bean sales double because the only adequate diet becomes the ⑧ **one** with one pound of rice and two pounds of beans.

In one psychological study of this phenomenon, two groups — one ④ **opposed** to and one ⑤ **supporting** capital punishment — each read two reports of carefully ⑥ **conducted** research on the effectiveness of the death penalty as a deterrent to crime. One report concluded that the death penalty was effective; ⑦ **another** concluded it ⑧ **was** not. ⑨ **Despite being exposed** to solid scientific information ⑩ **supporting** counter-arguments, the members of both groups became even more ⑪ **convinced** of the validity of their own position after reading both reports.They automatically accepted the supporting information and dismissed the conflicting information.

In our everyday lives we constantly use causal language. Sometimes this employs the word 'cause' (or its derivatives), for example 'She went through a red light and caused an accident', or language that implies that something ① **was caused**, 'I arrived late because I missed my flight'. In common speech we do not distinguish between things ② **caused** by human behaviour or non-human events (e.g. the brakes failed and this caused the car ③ **to crash**). Our everyday causal language is good enough for everyday events. However, in the sciences we require more precision. Pharmacologists must specify a precise dosage of a drug that will cause the desired effect, or indeed the maximum safe dosage; similarly accident investigators ④ **are required** to closely specify the circumstances that caused a crash. Though in the social sciences such precision is not ⑤ **required**, or indeed possible, a causal explanation ⑥ **is expected** to go beyond common sense. Indeed causal explanation is a central feature of social science ⑦ **because of** many, if not most, questions are about why something is the case. Yet specifying what a 'cause' is ⑧ **that** goes beyond common sense is not straightforward.

Observe a single ant and it doesn't make much sense — walking in one direction, suddenly careening in another for no obvious reason, ① **doubling** back on itself. Thoroughly unpredictable. The same happens with two ants, with a handful of ants. But a colony of ants makes fantastic sense. Specialized jobs, efficient means of exploiting new food sources, complex underground nests with temperature ② **regulated** within a few degrees. And critically, there's no blueprint or central source of command — each individual ant has algorithms for its behaviors. But this is not the wisdom of the crowd, ③ **where** a bunch of reasonably informed individuals outperform a single expert. The ants aren't reasonably ④ **informing** about the big picture. Instead, the behavior algorithms of each ant ⑤ **consist of** a few simple rules for interacting with the local environment and local ants. And out of this ⑥ **emerges** a highly efficient colony.

To be sure, the Internet is a human invention ① **reflecting** human choices and values. However, it often looks as if it is a separate species with an internal logic of its own. The 1987 stock market crash ② **has been blamed** on program trading — computers that started selling frantically because every other computer was selling. The ceaseless war between viruses and antivirus programs ③ **looks** eerily like the workings of a biological ecosystem. However, even if one posits that the Internet is comparable to a biological species, it's obvious that it's not very intelligent. It has primitive ways of "sensing" and "reacting," but it has no self-awareness and no ability to formulate its own goals. Nor ④ **could it** ever reach ⑤ **such** a state on its own. It could, however, be the backbone of a sophisticated new organism if physically ⑥ **integrating** with humanity. The Internet would become a new nervous system for humanity, and humanity would become a new body and executive brain for the Internet.

We frame losses and gains relative to a subjective reference point. This means that we ① **are concerned** not so much about absolute wealth, but about our relative wealth. For example, if I have bought a house for £150,000, then this is likely to become my reference point, and it is against this value ② **that** I measure any gains or losses. If I sell the house for more than £150,000, then I view this as a gain; if I sell the house for less than £150,000, then I view this as a loss. But note that my reference point may not remain ③ **static** over time. If I hear that, on average, house prices ④ **have increased** by 10 per cent in the period since I purchased the property, then I may shift my reference point and judge whether I have made a gain or loss relative to a reference value of £165,000. A parallel situation can ⑤ **be occurred** in stock markets ⑥ **where** I set the initial reference value according to the purchase price I paid for the shares, but I may shift the reference value in the future according to how the stock market has performed overall.

The contribution of culture to progress ① **has been called** the ratchet effect, ② **based** on an analogy with the tool that permits forward movement but prevents backward movement. Michael Tomasello, an expert who has written extensively about both primate and human thought capabilities, ③ **summarizes** the effect this way. Two things ④ **are needed** for progress. The first is innovation: Someone has to come up with a better solution to a common problem. ⑤ **Another** is preservation: The solution has to ⑥ **be transmitted** to others and ⑦ **remembered**, so everyone can continue using it even after the inventor or discoverer has died. Tomasello says that nonhuman apes actually are pretty good at coming up with novel, creative solutions to problems. For them (our biological relatives), the problem is with preservation. Even if the solver remembers the solution for a while, and even if a couple of his or her mates copy the solution and use it for a while, it is eventually ⑧ **forgotten**, and the next generation has to start over.

In Europe, it was not until the end of the eighteenth century ① **that** the musicians' guilds, which ② **had regulated** professional musical activities since the early Middle Ages, ③ **were replaced** by specific trade regulations that allowed and, indeed, ④ **forced** musicians ⑤ **to offer** their services to the general public for regular payment. As a consequence, a type of 'all-around musician' ⑥ **emerged**, characterized by the ability to cover a broad repertoire, from dance music to folk song, from parlor song to the music of the vaudeville theater. This type of all-around musicianship became a major force in the development of popular music. The changes and uncertainties of the market and the demands of the consuming audience did not permit a strict division of labor among musicians. Songwriters ⑦ **acted** customarily as band leaders, and performing musicians frequently played more than one instrument. Many musicians ⑧ **were forced** into an existence that hovered uneasily between ⑨ **that** of the professional and that of the semiprofessional. However, with the growth of urbanization and industrialization, an increasing specialization ⑩ **occurred**. Toward the end of the nineteenth century, popular musicians had clearly defined areas of work in dance music, in public entertainment and in music halls or musical theaters. These musicians frequently relied on a formal training — graduating from one of the conservatories and then leaving the world of classical music, or taking lessons from one of the many popular musicians who supported ⑪ **themselves** by giving lessons in addition to ⑫ **perform**.

Some years ago, I was the Director of Admission at a small private college. I will never forget the time when an applicant ① **named** John Graham rejected our rejection. The college was not particularly selective, but there ② **were** some minimum requirements for admission and John fell short on one or two key measures. A week after we sent out our admission decisions, I received a note from him ③ **asking** us to reconsider. He stated that he had not done well in high school because he had to work to help to support his family. I looked at his application again, but I did not believe he could succeed at our college with his low grades. I wrote "Young man, your goal of attending college is commendable, but there are many other options for you beyond our institution. For example, you might attend a community college and strengthen your academic foundation and then apply to transfer to our college later."

Weeks went by and then I received ④ **another** note from him: "Dear Sir, I asked that you ⑤ **reconsider** your decision not to admit me to your college. I failed ⑥ **to mention** that your college is my first choice school and I have not applied anywhere else. For these reasons and others, I must inform you that I cannot accept your rejection. I do ⑦ **hope** that it does not inconvenience the college too much but please expect ⑧ **to see** me at the school opening in the fall." The next time I encountered the young man, he was in the group at freshman orientation. He had found his way to campus and met with some of the staff in the Counseling Office. They were so ⑨ **impressed** with his story and his determination that they walked him over to the admission office and personally advocated for his acceptance. How could I stand in the way of a young person with that much drive and commitment ⑩ **to reach to** his goal? He got in! Patients show up with (often incorrect) ③ **self-diagnoses** derived from spending a couple of hours on the Internet. Many economic laws have been criticized as having only ① **statistical** necessity. Consider the law stating that the quantity sold varies ② **inversely** with its price. We can show that it is not universally ③ **true** with a thought experiment featuring an isolated village of peasants. The villagers can subsist on a weekly ration of one pound of rice and two pounds of beans or can subsist on the tastier and ④ **more nutritious** fare of one pound of rice, one pound of beans, and one pound of fish. Rice and beans each cost $1.00 per pound, but a pound of fish costs $1.20. Since the peasants are paid $3.20 a week, they spend it all on the rice, beans, and fish diet. What happens if the price of beans rises to $1.10? (It is ⑤ **impossible** to buy less than a pound of anything.) Bean sales double because the only ⑥ **inadequate** diet becomes the one with one pound of rice and two pounds of beans.

One report concluded that the death penalty was effective; the other concluded it was not. Despite being exposed to ⑤ **solid** scientific information supporting counter-arguments, the members of both groups became even more convinced of the ⑥ **invalidity** of their own position after reading both reports. In our everyday lives we constantly use ① **causal** language. Sometimes this employs the word 'cause' (or its derivatives), for example 'She went through a red light and caused an accident', or language that implies that something was caused, 'I arrived late because I missed my flight'. In common speech we do not ② **distinguish** between things caused by human behaviour or non-human events (e.g. the brakes failed and this caused the car to crash). Our everyday causal language is ③ **good** enough for everyday events. However, in the sciences we require ④ **more precision**. Pharmacologists must ⑤ **specify** a precise dosage of a drug that will cause the desired effect, or indeed the ⑥ **maximum** safe dosage; similarly accident investigators are required to closely ⑦ **specify** the circumstances that caused a crash. Though in the social sciences such precision is not required, or indeed possible, a causal explanation is expected to go beyond common sense. Indeed ⑧ **casual** explanation is a ⑨ **central** feature of social science because many, if not most, questions are about why something is the case. Yet specifying what a 'cause' is that goes beyond common sense is not ⑩ **straightforward**.

Observe a single ant and it doesn't make much sense — walking in one direction, suddenly careening in another for ① **no obvious** reason, doubling back on itself. Thoroughly ② **unpredictable**. The same happens with two ants, with a handful of ants. But a colony of ants makes ③ **fantastic** sense. Specialized jobs, efficient means of ④ **exploiting** new food sources, complex underground nests with temperature regulated within a few degrees. And critically, there's no blueprint or central source of command — each individual ant has algorithms for its behaviors. But this is not the wisdom of the crowd, where a bunch of reasonably informed individuals ⑤ **outperform** a single expert. The ants aren't reasonably informed about the ⑥ **big picture**. Instead, the behavior algorithms of each ant consist of a few simple rules for ⑦ **interrupting** with the local environment and local ants. And out of this emerges a highly ⑧ **efficient** colony.

For example, if I have bought a house for £150,000, then this is likely to become my reference point, and it is ③ **against** this value that I measure any gains or losses. If I sell the house for more than £150,000, then I view this as a gain; if I sell the house for less than £150,000, then I view this as a loss. But note that my reference point may not remain ④ **static** over time. If I hear that, on average, house prices have ⑤ **increased** by 10 per cent in the period since I purchased the property, then I may shift my reference point and judge whether I have made a gain or loss relative to a reference value of £165,000. A ⑥ **parallel** situation can occur in stock markets where I set the ⑦ **last** reference value according to the purchase price I paid for the shares, but I may ⑧ **shift** the reference value in the future according to how the stock market has performed overall.

Michael Tomasello, an expert who has written extensively about both primate and human thought capabilities, summarizes the effect this way. Two things are needed for ② **progress**. The first is innovation: Someone has to ③ **put up with** a better solution to a common problem. The other is ④ **preservation**: The solution has to be transmitted to others and remembered, so everyone can continue using it even after the inventor or discoverer has died. Tomasello says that nonhuman apes actually are pretty good at coming up with ⑤ **novel, creative** solutions to problems. For them (our biological relatives), the problem is with ⑥ **preservation**. _____. It doesn't matter if your screen is pumping out a restful, warm light and you're looking at soothing images. If you don't nod off because you're too busy looking at screens, your sleep will suffer. I'm sure we've all been aimlessly scrolling or working on something or checking social networking services in an endless loop, but know it's about time we got some sleep yet still can't seem to stop. A straightforward way of addressing this problem is to set a sleep alarm. You set an alarm for the morning, so set another for the evening too. This is when you have to switch off (in every sense of the word) and start getting ready for bed. You can't ignore your morning alarm if you want to keep your job, so the one you set for the evening has to become immovable too. You could swipe-proof your night-time sleep alarm by changing the settings on your smartphone to ban apps after a particular time. That way, you're more likely to focus on sleep, not apps.

Don't believe anyone who says that since nature is based on _____, we need to live like this as well. Many animals survive not by eliminating each other or keeping everything for themselves, but by cooperating and sharing. This applies most definitely to pack hunters, such as wolves or killer whales, but it also applies to our closest relatives, the primates. In a study done at Taï National Park, in Ivory Coast, chimpanzees took care of group mates wounded by leopards; they licked their mates' blood, carefully removed dirt, and waved away flies that came near the wounds. They protected injured companions and slowed down during travel in order to accommodate them. All of this makes perfect sense, given that chimpanzees live in groups for a reason, the same way wolves and humans are group animals for a reason. If man is wolf to man, he is so in every sense, not just the negative one. We would not be where we are today had our ancestors been socially aloof.

The physical environment directly determines the capacity for independent living of anyone with a difficulty or disability (difficulty walking, poor sight, impaired hearing, etc.). The idea is to encourage independent living through careful attention to architectural and urban design and services. In buildings, the absence of lifts or ramps can make life impossible for the elderly. The design of interior traffic and services areas can do the same. Outdoors, the absence of public benches, footpaths that are too narrow or too high, a road that is dangerous to cross, the difficulty or impossibility of boarding a bus or tram can force someone with impaired mobility to curtail their activities, or to stay at home. Bad design turns disabilities into handicaps. Poor design can be exacerbated by the "rudeness, insecurity and violence" that can be attendant on going outdoors. If these issues are not dealt with, _____.

While the term "ecosystem management" began appearing ever more frequently in scientific journals and government reports, it seemed that no two people could _____, as definitions of ecosystem management and practitioners or advocates of its use occurred in roughly equal numbers. So it seems strange that nearly everyone agreed that ecosystem management was a good thing. When ecosystem management became part of the process of deciding how to use public land, both the environmental community and those concerned with maintaining resource flows took a keen interest in defining ecosystem management in their own terms. Indeed, one observer suggested that when environmental groups heard the term "ecosystem management" they mainly heard "ecosystem," while industry groups heard "management." This led to the unsettling phenomenon of resource management agencies, conservationists, and industry representatives, who generally couldn't agree on what time it was, singing in unison the praises of ecosystem management at congressional hearings in the early 1990s.

Namibian communities have been receiving nearly $10 million a year from wildlife, says Fred Nelson, a wildlife expert who spent 11 years in Africa developing wildlife management partnerships. Since the revenues come primarily from trophy hunting and tourism ventures, local communities had a strong incentive to protect the animals and their habitat. These new incentives led to a natural resurgence in wildlife numbers. Even the number of black rhinos in Namibia rose from 707 in 1997 to 1,134 in 2004. Clearly, property rights to ownership or use and freedom to trade are among the keys to conservation. These incentives can encourage protection, care, and increased numbers, just as they do with cattle. Indeed, after legal action by private rhino holders, a judge in South Africa lifted the ban on domestic trade in rhino horn. Trade will give those farmers and communities that own rhinos an incentive to protect them. But where _____, the protection will be missing and poaching will probably continue.

_____ can have an impact on learners' perceived position in the course and may result in some learners not being able to interact as equals with other learners. Tony Bates, an author and educator, describes how culture influences critical thinking skills, debate, and discussion. In an online environment, learners are often encouraged to critically evaluate and debate the content being presented and share their ideas and knowledge in discussion. Cultural differences may affect the degree to which individual learners interact and can interfere with their ability to challenge ideas or express opinions contrary to those of the instructor or other learners in the class. Cultural differences can also affect learners who consider the instructor a higher power. If you participate in discussions and other activities by offering opinions on a topic or issue, a learner who views you as a higher power may find it difficult to offer opinions or ideas that are contrary to your opinions. Instructional activities that are teacher-directed tend to be best for learners from cultures with higher power distance, whereas lower power distance cultures prefer more learner-directed learning strategies.

In our everyday lives we constantly use causal language. Sometimes this employs the word 'cause' (or its derivatives), for example 'She went through a red light and caused an accident', or language that implies that something was caused, 'I arrived late because I missed my flight'. In common speech we do not distinguish between things caused by human behaviour or non-human events (e.g. the brakes failed and this caused the car to crash). Our everyday causal language is good enough for everyday events. However, in the sciences we require more precision. Pharmacologists must specify a precise dosage of a drug that will cause the desired effect, or indeed the maximum safe dosage; similarly accident investigators are required to closely specify the circumstances that caused a crash. Though in the social sciences such precision is not required, or indeed possible, a causal explanation is expected to _____. Indeed, causal explanation is a central feature of social science because many, if not most, questions are about why something is the case. Yet specifying what a 'cause' is that goes beyond common sense is not straightforward.

① develop our imagination
② go beyond common sense
③ learn from indirect experience
④ appreciate highly-developed language skills
⑤ have peace of mind and a positive attitude

Observe a single ant and it doesn't make much sense — walking in one direction, suddenly careening in another for no obvious reason, doubling back on itself. Thoroughly unpredictable. The same happens with two ants, with a handful of ants. But a colony of ants makes fantastic sense. Specialized jobs, efficient means of exploiting new food sources, complex underground nests with temperature regulated within a few degrees. And critically, there's no blueprint or central source of command — each individual ant has algorithms for its behaviors. But this is not the wisdom of the crowd, where a bunch of reasonably informed individuals outperform a single expert. The ants _____. Instead, the behavior algorithms of each ant consist of a few simple rules for interacting with the local environment and local ants. And out of this emerges a highly efficient colony.

In Europe, it was not until the end of the eighteenth century that the musicians' guilds, which had regulated professional musical activities since the early Middle Ages, were replaced by specific trade regulations that allowed and, indeed, forced musicians to offer their services to the general public for regular payment. ____**(C)**____, a type of 'all-around musician' emerged, characterized by the ability to cover a broad repertoire, from dance music to folk song, from parlor song to the music of the vaudeville theater. This type of all-around musicianship became a major force in the development of popular music. The changes and uncertainties of the market and the demands of the consuming audience **(A)**_____ among musicians. Songwriters acted customarily as band leaders, and performing musicians frequently played more than one instrument. Many musicians were forced into an existence that hovered uneasily between that of the professional and that of the semiprofessional. ____**(D)**____, with the growth of urbanization and industrialization, an increasing **(B)**_____ occurred. Toward the end of the nineteenth century, popular musicians had clearly defined areas of work in dance music, in public entertainment and in music halls or musical theaters. These musicians frequently relied on a formal training — graduating from one of the conservatories and then leaving the world of classical music, or taking lessons from one of the many popular musicians who supported themselves by giving lessons in addition to performing.

The contribution of culture to progress has been called the ratchet effect, based on an analogy with the tool that _____. Michael Tomasello, an expert who has written extensively about both primate and human thought capabilities, summarizes the effect this way. Two things are needed for progress. The first is innovation: Someone has to come up with a better solution to a common problem. The other is preservation: The solution has to be transmitted to others and remembered, so everyone can continue using it even after the inventor or discoverer has died. Tomasello says that nonhuman apes actually are pretty good at coming up with novel, creative solutions to problems. For them (our biological relatives), the problem is with preservation. Even if the solver remembers the solution for a while, and even if a couple of his or her mates copy the solution and use it for a while, it is eventually forgotten, and the next generation has to start over.

Don't believe anyone who says that since nature is based on a struggle for life, we need to live like this as well. Many animals survive not by eliminating each other or keeping everything for themselves, but by cooperating and sharing. This applies most definitely to pack hunters, such as wolves or killer whales, but it also applies to our closest relatives, the primates. In a study done at Taï National Park, in Ivory Coast, chimpanzees took care of group mates wounded by leopards; they licked their mates' blood, carefully removed dirt, and waved away flies that came near the wounds. They protected injured companions and slowed down during travel in order to accommodate them. All of this makes perfect sense, given that chimpanzees live in groups for a reason, the same way wolves and humans are group animals for a reason. If man is wolf to man, he is so in every sense, not just the negative one. We would not be where we are today had our ancestors _____.

① caved in to group pressure

③ had problems with their vision
④ roped the other group members in

The _____ directly determines the capacity for independent living of anyone with a difficulty or disability (difficulty walking, poor sight, impaired hearing, etc.). The idea is to encourage independent living through careful attention to architectural and urban design and services. In buildings, the absence of lifts or ramps can make life impossible for the elderly. The design of interior traffic and services areas can do the same. Outdoors, the absence of public benches, footpaths that are too narrow or too high, a road that is dangerous to cross, the difficulty or impossibility of boarding a bus or tram can force someone with impaired mobility to curtail their activities, or to stay at home. Bad design turns disabilities into handicaps. Poor design can be exacerbated by the "rudeness, insecurity and violence" that can be attendant on going outdoors. If these issues are not dealt with, a vicious circle of dependence develops.

Differences in power distance can have an impact on learners' perceived position in the course and may result in some learners not being able to interact as equals with other learners. Tony Bates, an author and educator, describes how _____ influences critical thinking skills, debate, and discussion. In an online environment, learners are often encouraged to critically evaluate and debate the content being presented and share their ideas and knowledge in discussion. Cultural differences may affect the degree to which individual learners interact and can interfere with their ability to challenge ideas or express opinions contrary to those of the instructor or other learners in the class. Cultural differences can also affect learners who consider the instructor a higher power. If you participate in discussions and other activities by offering opinions on a topic or issue, a learner who views you as a higher power may find it difficult to offer opinions or ideas that are contrary to your opinions. Instructional activities that are teacher-directed tend to be best for learners from cultures with higher power distance, whereas lower power distance cultures prefer more learner-directed learning strategies.

Unfortunately, unemployment programs have an unintended secondary effect: They _____. The benefits make it less costly for an unemployed worker to turn down available jobs and continue searching while receiving the payments. They also reduce the incentive of the unemployed to switch occupations or move to another location in order to find employment. As a result, workers stay unemployed longer and the overall unemployment rate is higher than it would be otherwise. In fact, empirical evidence indicates that there is a spike in the number of unemployed workers obtaining employment just before and immediately after their unemployment benefits are exhausted. The persistently higher unemployment rates in Europe, where the benefits are more generous, also indicate that the program pushes the unemployment rate upward, perhaps by as much as 2 or 3 percentage points.

Namibian communities have been receiving nearly $10 million a year from wildlife, says Fred Nelson, a wildlife expert who spent 11 years in Africa developing wildlife management partnerships. Since the revenues come primarily from trophy hunting and tourism ventures, local communities had a strong incentive to protect the animals and their habitat. These new incentives led to a natural resurgence in wildlife numbers. Even the number of black rhinos in Namibia rose from 707 in 1997 to 1,134 in 2004. Clearly, _____ are among the keys to conservation. These incentives can encourage protection, care, and increased numbers, just as they do with cattle. Indeed, after legal action by private rhino holders, a judge in South Africa lifted the ban on domestic trade in rhino horn. Trade will give those farmers and communities that own rhinos an incentive to protect them. But where ownership and trade are prohibited, the protection will be missing and poaching will probably continue.

① developments of an online interface with enhanced user autonomy
② efforts to manipulate people into consuming digital content
③ the increasing integrations of social classes
④ property rights to ownership or use and freedom to trade
⑤ reliance upon old-fashioned rules for good behavior

There are a number of ways our selfish behaviour can be moderated, especially when attention is drawn to us. For example, simply looking in a mirror forces adults literally to self-reflect, which studies have shown reduces cheating on a test. This effect of mirrored self-focus on morality is consistent with recent studies demonstrating that merely hanging up posters of staring human eyes doubled the number of diners that cleaned up after themselves after they had finished their meals. When we think we are being watched, we tend to behave ourselves. If the fear of exposure regulates our transgressions, then religions with an all-seeing God may operate to foster moral behaviour precisely because followers think that they are constantly observed. Most of the world's religions promote prosociality in their teachings and practices. There is a common assumption that religions _____, as epitomized by the parable of the Good Samaritan in Christianity.

① foster kindness and generosity
② convince them to work harder
③ point out their wrong behaviors
④ force them to endure the conditions
⑤ make a complaint about their company

Consider the old saying "A little learning is a dangerous thing." As individuals, we are quick to access information that helps us. But we often _____. One of us has a brother who is a medical doctor. He encounters this problem on a daily basis (and we might add, he is not too happy about it). Patients show up with (often incorrect) self-diagnoses derived from spending a couple of hours on the Internet. It is the same in business: senior executives second-guess their subordinates because their corporate IT system gives them line of sight down to detailed plant-level data. At a societal level, people believe they have the right to information that is in the public interest (think Wikileaks), but they are rarely capable of interpreting and using it in a sensible way.

① see what's the same about many different things

⑤ suggest that the essence of mathematics is problem solving

Many economic laws have been criticized as having only statistical necessity. Consider the law stating that the quantity sold _____. We can show that it is not universally true with a thought experiment featuring an isolated village of peasants. The villagers can subsist on a weekly ration of one pound of rice and two pounds of beans or can subsist on the tastier and more nutritious fare of one pound of rice, one pound of beans, and one pound of fish. Rice and beans each cost $1.00 per pound, but a pound of fish costs $1.20. Since the peasants are paid $3.20 a week, they spend it all on the rice, beans, and fish diet. What happens if the price of beans rises to $1.10? (It is impossible to buy less than a pound of anything.) Bean sales double because the only adequate diet becomes the one with one pound of rice and two pounds of beans.

① increases our uncertainties
② varies inversely with its price
③ places limits on our worries
④ shares specific worries with others
⑤ differentiates reality from the ideal

The confirming-evidence bias not only affects where we go to collect evidence, but also _____, leading us to give too much weight to supporting information and too little to conflicting information. In one psychological study of this phenomenon, two groups — one opposed to and one supporting capital punishment — each read two reports of carefully conducted research on the effectiveness of the death penalty as a deterrent to crime. One report concluded that the death penalty was effective; the other concluded it was not. Despite being exposed to solid scientific information supporting counter-arguments, the members of both groups became even more convinced of the validity of their own position after reading both reports.They automatically accepted the supporting information and dismissed the conflicting information.

② how we interpret the evidence we do receive
③ how we intensify the argument between conflicting theories
④ how we weed out those that do not fit the evidence
⑤ how we reject those that lack negative instances

We frame losses and gains relative to _____. This means that we are concerned not so much about absolute wealth, but about our relative wealth. For example, if I have bought a house for £150,000, then this is likely to become my reference point, and it is against this value that I measure any gains or losses. If I sell the house for more than £150,000, then I view this as a gain; if I sell the house for less than £150,000, then I view this as a loss. But note that my reference point may not remain static over time. If I hear that, on average, house prices have increased by 10 per cent in the period since I purchased the property, then I may shift my reference point and judge whether I have made a gain or loss relative to a reference value of £165,000. If I sell the house for more than £150,000, then I view this as a gain; if I sell the house for less than £150,000, then I view this as a loss. But note that my reference point may _____. If I hear that, on average, house prices have increased by 10 per cent in the period since I purchased the property, then I may shift my reference point and judge whether I have made a gain or loss relative to a reference value of £165,000. A parallel situation can occur in stock markets where I set the initial reference value according to the purchase price I paid for the shares, but I may shift the reference value in the future according to how the stock market has performed overall.

The contribution of culture to progress has been called the ratchet effect, based on an analogy with the tool that permits forward movement but prevents backward movement. Michael Tomasello, an expert who has written extensively about both primate and human thought capabilities, summarizes the effect this way. Two things are needed for progress. The first is innovation: Someone has to come up with a better solution to a common problem. The other is preservation: The solution has to be transmitted to others and remembered, so everyone can continue using it even after the inventor or discoverer has died. Tomasello says that nonhuman apes actually are pretty good at coming up with novel, creative solutions to problems. For them (our biological relatives), the problem is with _____. Even if the solver remembers the solution for a while, and even if a couple of his or her mates copy the solution and use it for a while, it is eventually forgotten, and the next generation has to start over.

① prejudice
② consensus
③ preservation
④ contradiction
⑤ independence

All of this makes perfect sense, given that chimpanzees live in groups for a reason, the same way wolves and humans are group animals for a reason.

Don't believe anyone who says that since nature is based on a struggle for life, we need to live like this as well. ① Many animals survive not by eliminating each other or keeping everything for themselves, but by cooperating and sharing. ② This applies most definitely to pack hunters, such as wolves or killer whales, but it also applies to our closest relatives, the primates. ③ In a study done at Taï National Park, in Ivory Coast, chimpanzees took care of group mates wounded by leopards; they licked their mates' blood, carefully removed dirt, and waved away flies that came near the wounds. ④ They protected injured companions and slowed down during travel in order to accommodate them. ⑤ If man is wolf to man, he is so in every sense, not just the negative one. The design of interior traffic and services areas can do the same.

The physical environment directly determines the capacity for independent living of anyone with a difficulty or disability (difficulty walking, poor sight, impaired hearing, etc.). ① The idea is to encourage independent living through careful attention to architectural and urban design and services. ② In buildings, the absence of lifts or ramps can make life impossible for the elderly. ③ Outdoors, the absence of public benches, footpaths that are too narrow or too high, a road that is dangerous to cross, the difficulty or impossibility of boarding a bus or tram can force someone with impaired mobility to curtail their activities, or to stay at home. ④ Bad design turns disabilities into handicaps. ⑤ Poor design can be exacerbated by the "rudeness, insecurity and violence" that can be attendant on going outdoors. If these issues are not dealt with, a vicious circle of dependence develops.

① While the term "ecosystem management" began appearing ever more frequently in scientific journals and government reports, it seemed that no two people could agree on what it meant, as definitions of ecosystem management and practitioners or advocates of its use occurred in roughly equal numbers. ② So it seems strange that nearly everyone agreed that ecosystem management was a good thing. ③ When ecosystem management became part of the process of deciding how to use public land, both the environmental community and those concerned with maintaining resource flows took a keen interest in defining ecosystem management in their own terms. ④ This led to the unsettling phenomenon of resource management agencies, conservationists, and industry representatives, who generally couldn't agree on what time it was, singing in unison the praises of ecosystem management at congressional hearings in the early 1990s. ⑤

Indeed, after legal action by private rhino holders, a judge in South Africa lifted the ban on domestic trade in rhino horn.

Namibian communities have been receiving nearly $10 million a year from wildlife, says Fred Nelson, a wildlife expert who spent 11 years in Africa developing wildlife management partnerships. Since the revenues come primarily from trophy hunting and tourism ventures, local communities had a strong incentive to protect the animals and their habitat. ① These new incentives led to a natural resurgence in wildlife numbers. ② Even the number of black rhinos in Namibia rose from 707 in 1997 to 1,134 in 2004. ③ Clearly, property rights to ownership or use and freedom to trade are among the keys to conservation. ④ These incentives can encourage protection, care, and increased numbers, just as they do with cattle. ⑤ Trade will give those farmers and communities that own rhinos an incentive to protect them. But where ownership and trade are prohibited, the protection will be missing and poaching will probably continue.

Cultural differences can also affect learners who consider the instructor a higher power.

Differences in power distance can have an impact on learners' perceived position in the course and may result in some learners not being able to interact as equals with other learners. ① Tony Bates, an author and educator, describes how culture influences critical thinking skills, debate, and discussion. ② In an online environment, learners are often encouraged to critically evaluate and debate the content being presented and share their ideas and knowledge in discussion. ③ Cultural differences may affect the degree to which individual learners interact and can interfere with their ability to challenge ideas or express opinions contrary to those of the instructor or other learners in the class. ④ If you participate in discussions and other activities by offering opinions on a topic or issue, a learner who views you as a higher power may find it difficult to offer opinions or ideas that are contrary to your opinions. ⑤ Instructional activities that are teacher-directed tend to be best for learners from cultures with higher power distance, whereas lower power distance cultures prefer more learner-directed learning strategies.

In fact, empirical evidence indicates that there is a spike in the number of unemployed workers obtaining employment just before and immediately after their unemployment benefits are exhausted.

Unfortunately, unemployment programs have an unintended secondary effect: They increase the unemployment rate. ① The benefits make it less costly for an unemployed worker to turn down available jobs and continue searching while receiving the payments. ② They also reduce the incentive of the unemployed to switch occupations or move to another location in order to find employment. ③ As a result, workers stay unemployed longer and the overall unemployment rate is higher than it would be otherwise. ④ The persistently higher unemployment rates in Europe, where the benefits are more generous, also indicate that the program pushes the unemployment rate upward, perhaps by as much as 2 or 3 percentage points. ⑤

Sharing food both on a day-to-day basis and on special occasions is part of the complex of behaviors that now defines how humans are social.

The sense of familial and cultural solidarity that comes with feasting can be very pleasant and reassuring, rewarding in ways both nutritional and psychological. ① Eating to 120 percent full is probably a pretty standard performance at a feast, so over the course of a million-plus years of feasting, a strong psychological association likely evolved between being extra full and a sense of social well-being. ② The importance of social life to human beings cannot be underestimated. ③ The common ancestor we shared with chimpanzees millions of years ago was likely a highly social species, just as chimpanzees and we are today. ④ Over the course of our evolution, humans gained a tool — language — that has helped our kind to ratchet up all aspects of social life. ⑤ In a less profound or obvious way, occasional overeating may also be part of this complex.

We can show that it is not universally true with a thought experiment featuring an isolated village of peasants.

Many economic laws have been criticized as having only statistical necessity. ① Consider the law stating that the quantity sold varies inversely with its price. ② The villagers can subsist on a weekly ration of one pound of rice and two pounds of beans or can subsist on the tastier and more nutritious fare of one pound of rice, one pound of beans, and one pound of fish. ③ Rice and beans each cost $1.00 per pound, but a pound of fish costs $1.20. ④ Since the peasants are paid $3.20 a week, they spend it all on the rice, beans, and fish diet. ⑤ What happens if the price of beans rises to $1.10? Indeed, causal explanation is a central feature of social science because many, if not most, questions are about why something is the case.

In our everyday lives we constantly use causal language. Sometimes this employs the word 'cause' (or its derivatives), for example 'She went through a red light and caused an accident', or language that implies that something was caused, 'I arrived late because I missed my flight'. In common speech we do not distinguish between things caused by human behaviour or non-human events (e.g. the brakes failed and this caused the car to crash). ① Our everyday causal language is good enough for everyday events. ② However, in the sciences we require more precision. ③ Pharmacologists must specify a precise dosage of a drug that will cause the desired effect, or indeed the maximum safe dosage; similarly accident investigators are required to closely specify the circumstances that caused a crash. ④ Though in the social sciences such precision is not required, or indeed possible, a causal explanation is expected to go beyond common sense. ⑤ Yet specifying what a 'cause' is that goes beyond common sense is not straightforward.

In Europe, it was not until the end of the eighteenth century that the musicians' guilds, which had regulated professional musical activities since the early Middle Ages, were replaced by specific trade regulations that allowed and, indeed, forced musicians to offer their services to the general public for regular payment. As a consequence, a type of 'all-around musician' emerged, characterized by the ability to cover a broad repertoire, from dance music to folk song, from parlor song to the music of the vaudeville theater. ① This type of all-around musicianship became a major force in the development of popular music. ② Songwriters acted customarily as band leaders, and performing musicians frequently played more than one instrument. ③ Many musicians were forced into an existence that hovered uneasily between that of the professional and that of the semiprofessional. ④ Toward the end of the nineteenth century, popular musicians had clearly defined areas of work in dance music, in public entertainment and in music halls or musical theaters. ⑤ These musicians frequently relied on a formal training — graduating from one of the conservatories and then leaving the world of classical music, or taking lessons from one of the many popular musicians who supported themselves by giving lessons in addition to performing.

Tech eats into sleep time. It doesn't matter if your screen is pumping out a restful, warm light and you're looking at soothing images. If you don't nod off because you're too busy looking at screens, your sleep will suffer. ① I'm sure we've all been aimlessly scrolling or working on something or checking social networking services in an endless loop, but know it's about time we got some sleep yet still can't seem to stop. ② A straightforward way of addressing this problem is to set a sleep alarm. ③ You set an alarm for the morning, so set another for the evening too. ④ This is when you have to switch off (in every sense of the word) and start getting ready for bed. ⑤ It's not unlike hitting the snooze button on your alarm clock only to pull the covers over your head and fall back asleep. You can't ignore your morning alarm if you want to keep your job, so the one you set for the evening has to become immovable too. You could swipe-proof your night-time sleep alarm by changing the settings on your smartphone to ban apps after a particular time. That way, you're more likely to focus on sleep, not apps.

Don't believe anyone who says that since nature is based on a struggle for life, we need to live like this as well. If man is wolf to man, he is so in every sense, not just the negative one. We would not be where we are today had our ancestors been socially aloof.

The physical environment directly determines the capacity for independent living of anyone with a difficulty or disability (difficulty walking, poor sight, impaired hearing, etc.). ① The idea is to encourage independent living through careful attention to architectural and urban design and services. ② In buildings, the absence of lifts or ramps can make life impossible for the elderly. ③ The design of interior traffic and services areas can do the same. ④ Outdoors, the absence of public benches, footpaths that are too narrow or too high, a road that is dangerous to cross, the difficulty or impossibility of boarding a bus or tram can force someone with impaired mobility to curtail their activities, or to stay at home. ⑤ A good memorial should be designed in a way that best helps observers to actually feel what was experienced during the memorialized event. Bad design turns disabilities into handicaps. Poor design can be exacerbated by the "rudeness, insecurity and violence" that can be attendant on going outdoors. If these issues are not dealt with, a vicious circle of dependence develops.

Namibian communities have been receiving nearly $10 million a year from wildlife, says Fred Nelson, a wildlife expert who spent 11 years in Africa developing wildlife management partnerships. ① Since the revenues come primarily from trophy hunting and tourism ventures, local communities had a strong incentive to protect the animals and their habitat. ② These new incentives led to a natural resurgence in wildlife numbers. ③ Even the number of black rhinos in Namibia rose from 707 in 1997 to 1,134 in 2004. ④ Clearly, property rights to ownership or use and freedom to trade are among the keys to conservation. ⑤ While you might think environmental protection would top all other priorities, the reality is that conservation efforts are often made secondary to other pressures like economic development. These incentives can encourage protection, care, and increased numbers, just as they do with cattle. Indeed, after legal action by private rhino holders, a judge in South Africa lifted the ban on domestic trade in rhino horn. Trade will give those farmers and communities that own rhinos an incentive to protect them. But where ownership and trade are prohibited, the protection will be missing and poaching will probably continue.

In our everyday lives we constantly use causal language. Sometimes this employs the word 'cause' (or its derivatives), for example 'She went through a red light and caused an accident', or language that implies that something was caused, 'I arrived late because I missed my flight'. ① In common speech we do not distinguish between things caused by human behaviour or non-human events (e.g. the brakes failed and this caused the car to crash). ② Our everyday causal language is good enough for everyday events. ③ However, in the sciences we require more precision. ④ Pharmacologists must specify a precise dosage of a drug that will cause the desired effect, or indeed the maximum safe dosage; similarly accident investigators are required to closely specify the circumstances that caused a crash. ⑤ We can see this on a grand scale or in the most ordinary circumstances. Though in the social sciences such precision is not required, or indeed possible, a causal explanation is expected to go beyond common sense. Indeed causal explanation is a central feature of social science because many, if not most, questions are about why something is the case. Yet specifying what a 'cause' is that goes beyond common sense is not straightforward.

The same happens with two ants, with a handful of ants. But a colony of ants makes fantastic sense. ① Specialized jobs, efficient means of exploiting new food sources, complex underground nests with temperature regulated within a few degrees. ② And critically, there's no blueprint or central source of command — each individual ant has algorithms for its behaviors. ③ But this is not the wisdom of the crowd, where a bunch of reasonably informed individuals outperform a single expert. ④ To ensure that every research project has this protection, investigators must submit their proposed studies for formal review by a local panel of experts and community representatives prior to any data collection. ⑤ The ants aren't reasonably informed about the big picture. Instead, the behavior algorithms of each ant consist of a few simple rules for interacting with the local environment and local ants. And out of this emerges a highly efficient colony.

We frame losses and gains relative to a subjective reference point. This means that we are concerned not so much about absolute wealth, but about our relative wealth. ① For example, if I have bought a house for £150,000, then this is likely to become my reference point, and it is against this value that I measure any gains or losses. ② If I sell the house for more than £150,000, then I view this as a gain; if I sell the house for less than £150,000, then I view this as a loss. But note that my reference point may not remain static over time. ③ If I hear that, on average, house prices have increased by 10 per cent in the period since I purchased the property, then I may shift my reference point and judge whether I have made a gain or loss relative to a reference value of £165,000. ④ It fails to connect any other advantages the product may have with other outcomes and, therefore, no longer communicates the true value of the product. ⑤ A parallel situation can occur in stock markets where I set the initial reference value according to the purchase price I paid for the shares, but I may shift the reference value in the future according to how the stock market has performed overall.

The contribution of culture to progress has been called the ratchet effect, based on an analogy with the tool that permits forward movement but prevents backward movement. ① Michael Tomasello, an expert who has written extensively about both primate and human thought capabilities, summarizes the effect this way. ② Two things are needed for progress. ③ The first is innovation: Someone has to come up with a better solution to a common problem. ④ When we are focused on finding solutions, it's clear that a simple request is the most productive approach to take, whereas a winding path of steps is not. ⑤ The other is preservation: The solution has to be transmitted to others and remembered, so everyone can continue using it even after the inventor or discoverer has died. Tomasello says that nonhuman apes actually are pretty good at coming up with novel, creative solutions to problems. For them (our biological relatives), the problem is with preservation. Even if the solver remembers the solution for a while, and even if a couple of his or her mates copy the solution and use it for a while, it is eventually forgotten, and the next generation has to start over.

(A) A parallel situation can occur in stock markets where I set the initial reference value according to the purchase price I paid for the shares, but I may shift the reference value in the future according to how the stock market has performed overall.

(B) But note that my reference point may not remain static over time. If I hear that, on average, house prices have increased by 10 per cent in the period since I purchased the property, then I may shift my reference point and judge whether I have made a gain or loss relative to a reference value of £165,000.

(C) For example, if I have bought a house for £150,000, then this is likely to become my reference point, and it is against this value that I measure any gains or losses. If I sell the house for more than £150,000, then I view this as a gain; if I sell the house for less than £150,000, then I view this as a loss.

The contribution of culture to progress has been called the ratchet effect, based on an analogy with the tool that permits forward movement but prevents backward movement.

(A) The other is preservation: The solution has to be transmitted to others and remembered, so everyone can continue using it even after the inventor or discoverer has died. Tomasello says that nonhuman apes actually are pretty good at coming up with novel, creative solutions to problems.

(B) For them (our biological relatives), the problem is with preservation. Even if the solver remembers the solution for a while, and even if a couple of his or her mates copy the solution and use it for a while, it is eventually forgotten, and the next generation has to start over.

(C) Michael Tomasello, an expert who has written extensively about both primate and human thought capabilities, summarizes the effect this way. Two things are needed for progress. The first is innovation: Someone has to come up with a better solution to a common problem.

In Europe, it was not until the end of the eighteenth century that the musicians' guilds, which had regulated professional musical activities since the early Middle Ages, were replaced by specific trade regulations that allowed and, indeed, forced musicians to offer their services to the general public for regular payment.

(A) Toward the end of the nineteenth century, popular musicians had clearly defined areas of work in dance music, in public entertainment and in music halls or musical theaters. These musicians frequently relied on a formal training — graduating from one of the conservatories and then leaving the world of classical music, or taking lessons from one of the many popular musicians who supported themselves by giving lessons in addition to performing.

(B) As a consequence, a type of 'all-around musician' emerged, characterized by the ability to cover a broad repertoire, from dance music to folk song, from parlor song to the music of the vaudeville theater. This type of all-around musicianship became a major force in the development of popular music. The changes and uncertainties of the market and the demands of the consuming audience did not permit a strict division of labor among musicians.

(C) Songwriters acted customarily as band leaders, and performing musicians frequently played more than one instrument. Many musicians were forced into an existence that hovered uneasily between that of the professional and that of the semiprofessional. However, with the growth of urbanization and industrialization, an increasing specialization occurred.

Ms. Carter was a teacher who everyone said **[to be / was]** so hard in her grading. She kept **[to tell / telling]** us in class **[that / what]** she was willing to go over our papers beforehand with us during her office hours. At the time I thought, "Well, I don't think I'll go to your office and have you **[chop / to print]** up my paper." Then I tried to actually write the paper over the weekend, but I found **[that / what]** I was clueless. Tech eats into sleep time. It doesn't matter if your screen is pumping out a restful, warm light and you're looking at soothing images. If you don't nod off because you're too busy **[looking / to look]** at screens, your sleep will suffer. I'm sure we've all been aimlessly scrolling or working on something or checking social networking services in an endless loop, but **[knowing / know]** it's about time we got some sleep yet still can't seem **[to stop / stopping]**. A straightforward way of addressing this problem is to set a sleep alarm. You set an alarm for the morning, so set **[another / other]** for the evening too. This is when you have to switch off (in every sense of the word) and start getting ready for bed. You can't ignore your morning alarm if you want to keep your job, so the one you set for the evening has to become immovable too. You could swipe-proof your night-time sleep alarm by changing the settings on your smartphone **[to ban / ban]** apps after a particular time. That way, you're more likely **[focus / to focus]** on sleep, not apps.

Don't believe anyone who says **[that / what]** since nature **[bases / is based]** on a struggle for life, we need to live like this as well. Many animals survive not by eliminating each other or keeping everything for **[them / themselves]**, but by cooperating and sharing. This applies most definitely to pack hunters, such as wolves or killer whales, but it also applies to our closest relatives, the primates. In a study **[was done / done]** at Taï National Park, in Ivory Coast, chimpanzees took care of group mates **[wounded / were wounded]** by leopards; they licked their mates' blood, carefully **[removing / removed]** dirt, and waved away flies **[that / what]** came near the wounds. They protected injured companions and slowed down during travel in order to accommodate them. All of this makes perfect sense, **[giving / given]** **[that / what]** chimpanzees live in groups for a reason, the same way wolves and humans are group animals for a reason. If man is wolf to man, he is so in every sense, not just the negative **[one / ones]**. We would not **[be / have been]** where we are today **[our ancestors had / had our ancestors]** been socially aloof.

The physical environment directly determines the capacity for independent living of anyone with a difficulty or disability (difficulty walking, poor sight, **[impairing / impaired]** hearing, etc.). The idea is to encourage independent living through careful attention to architectural and urban design and services. In buildings, the absence of lifts or ramps can make life **[impossible / impossibly]** for the elderly. The design of interior traffic and services areas can do the same. Outdoors, the absence of public benches, footpaths **[that / what]** are too narrow or too **[high / highly]**, a road **[that / what]** is dangerous to cross, the difficulty or impossibility of boarding a bus or tram can force someone with impaired mobility **[to curtail / curtailing]** their activities, or **[to stay / staying]** at home. Bad design turns disabilities into handicaps. Poor design can **[exacerbate / be exacerbated]** by the "rudeness, insecurity and violence" **[that / what]** can be attendant on going outdoors. If these issues are not **[dealing / dealt]** with, a vicious circle of dependence develops.

When ecosystem management became part of the process of deciding how to use public land, both the environmental community and **[that / those]** **[concerning / concerned]** with maintaining resource flows took a keen interest in defining ecosystem management in their own terms. Indeed, one observer suggested **[that / what]** when environmental groups heard the term "ecosystem management" they mainly heard "ecosystem," while industry groups heard "management." Namibian communities have been receiving nearly $10 million a year from wildlife, says Fred Nelson, a wildlife expert who spent 11 years in Africa **[developing / developed]** wildlife management partnerships. Since the revenues come primarily from trophy hunting and tourism ventures, local communities had a strong incentive **[protect / to protect]** the animals and their habitat. These new incentives led to a natural resurgence in wildlife numbers. Even the number of black rhinos in Namibia **[rose / raised]** from 707 in 1997 to 1,134 in 2004. Clearly, property rights to ownership or use and freedom to trade **[is / are]** among the keys to conservation. Boyle's most famous works were New Experiments Physico-Mechanical, Touching the Spring of the Air and Its Effects, The Skeptical Chemist, and The Experimental History of Colors. He also wrote a religious novel, Seraphic Love.

There are a number of ways our selfish behaviour can **[moderate / be moderated]**, especially when attention **[draws / is drawn]** to us. Consider the old saying "A little learning is a dangerous thing." As individuals, we are quick **[to access / accessing]** information **[that / what]** helps us. Ms. Carter was a teacher **(A)**<u>점수를 주는 데 너무 깐깐하다고 누구나 말하는</u>. She kept **(B)**<u>**tell**</u> us in class that she was willing to go over our papers beforehand with us during her office hours. Robert Boyle (1627–1691) was the fourteenth child of the first Earl of Cork, who was the richest man in England. As the founder of modern chemistry, Boyle devoted his life to scientific investigation and methodology. He was well-received at the British Court, and a member of the council of the Royal Society, although he declined its presidency and the provostship of Eton because he did not want to "take oaths." When he retired to a house in Pall Mall after a stroke at age 42, he maintained his own laboratory. Boyle's goal was to replace Aristotelian mechanics with explanations using just two things: matter and motion. He was also a champion of the new atomism, or "corpuscular theory." Boyle's most famous works were New Experiments Physico-Mechanical, Touching the Spring of the Air and Its Effects, The Skeptical Chemist, and The Experimental History of Colors. He also wrote a religious novel, Seraphic Love.

In our everyday lives we constantly use **(A)[casual / causal]** language. Sometimes this employs the word 'cause' (or its derivatives), for example 'She went through a red light and caused an accident', or language that implies that something **(B)cause**, 'I arrived late because I missed my flight'. In common speech we do not **(C)[distinguish / polish]** between things **(D)cause** by human behaviour or non-human events (e.g. the brakes failed and this caused the car **(E)crash**). Our everyday **(F)[casual / causal]** language is **(G)[good / bad]** enough for everyday events. However, in the sciences we require **(H)[more precision / less precision]**. Pharmacologists must **(I)[fortify / specify]** a precise dosage of a drug that will cause the desired effect, or indeed the **(J)[minimum / maximum]** safe dosage; similarly accident investigators **(K)require** to closely **(L)[fortify / specify]** the circumstances that caused a crash. Though in the social sciences such precision is not **(M)require**, or indeed possible, a **(N)[casual / causal]** explanation **(O)expect go** beyond common sense. Indeed, **(P)[casual / causal]** explanation is a **(Q)[central / trivial]** feature of social science **(R)because of** many, if not most, questions are about why something is the case. Yet specifying **(S)how** a 'cause' is that goes beyond common sense **(T)be** not **(U)[complicated / straightforward]**.

To be sure, the Internet is a human invention reflecting human choices and values. However, it often looks as if it is a(n) **(A)[identical / separate]** species with an internal logic of its own. The 1987 stock market crash has been blamed on program trading — computers that started selling **(B)[frantically / familiarly]** because every other computer was selling. The **(C)[ceaseless / occasional]** war between viruses and antivirus programs looks eerily like the workings of a(n) **(D)[biological ecosystem / obsolete information]**. We frame losses and gains relative to a **(A)[objective / subjective]** reference point. **(B)<u>This</u>** means that **(C)<u>우리가 절대적인 부보다는 오히려 우리의 상대적 부에 관심이 있다는 것</u>**. For example, if I have bought a house for £150,000, then **(D)<u>this</u>** is likely to become my reference point, and it is **(E)[for / against]** **(F)<u>this value</u>** that I measure any gains or losses. If I sell the house for more than £150,000, then I view **(G)<u>this</u>** as a gain; if I sell the house for less than £150,000, then I view **(H)<u>this</u>** as a loss. But note that my reference point may **(I)<u>not remain static over time</u>**. If I hear that, on average, house prices have **(J)[increased / decreased]** by 10 per cent in the period since I purchased the property, then I may shift my reference point and judge whether I have made a gain or loss relative to a reference value of £165,000. A **(K)[parallel / different]** situation can occur in stock markets where I set the **(L)[initial / last]** reference value according to the purchase price I paid for the shares, but I may **(M)[shift / shiver]** the reference value in the future according to how the stock market has performed overall.

Some years ago, I was the Director of Admission at a small private college. I will never forget the time when an applicant **(A)name** John Graham **(B)[accepted / rejected]** our **(C)**_____. The college was not particularly **(D)[effective / selective]**, but there **(E)be** some **(F)[maximum / minimum]** requirements for admission and John fell short on one or two key measures. A week after we sent out our admission decisions, I received a note from him **(G)ask** us to reconsider. He stated that he had not done well in high school because he had to work to help to support his family. I looked at his application again, but I did not believe he could succeed at our college with his low grades. I wrote "Young man, your goal of attending college is **(H)[dependable / commendable]**, but there are many other options for you beyond our institution. For example, you might attend a community college and **(I)[strengthen / weaken]** your academic foundation and then apply to transfer to our college later."

Weeks went by and then I received **(J)other** note from him: "Dear Sir, I asked that you **(K)**_____ **(L)reconsider** your decision not to **(M)[admit / reject]** me to your college. I failed **(N)mention** that your college is my first choice school and I have not applied anywhere else. How could I stand in the way of a young person with that much drive and commitment **(X)reach** his goal? He got in!
