1	Modern theories have applied and extended early principles to understand people's behavior when people have the
	opportunity to interact with others while concealing their personal identity and remaining anonymous.
2	The term deindividuation was coined by Leon Festinger and colleagues in the 1950s to describe situations in which people
	cannot be individuated or isolated from others.
3	According to Festinger and colleagues, being deindividuated brings about a loss of individuality.
J	According to restinger and coneagues, being demonduated brings about a loss of individuanty.
4	They proposed that being deindividuated reduces normal constraints on behavior and people can do things they normally

1	Suppose you were participating in an experiment using a new saliva test to detect an enzyme deficiency that predicted
	pancreatic disease in later life.
	How much would you believe in the accuracy of the new test?
3	According to a study done by Peter Ditto and David Lopez on Kent State University students, that would depend on
	whether the test identified you as possessing the worrisome deficiency.
4	Like the majority of those students, you would likely downgrade the accuracy of the test if it informed you that pancreas
	problems were in your future.
	A second study showed how you might go about it.
J	A second study showed how you might go about it.
6	Ditto and Lopez asked subjects if there were any irregularities in their diet, sleep, or activity patterns over the last 48 hours
	that might have affected the accuracy of the test.
7	Those who got health-threatening results listed three times more "irregularities" than did those receiving health-confirming
	results.
8	Thus, they searched for ways to weaken evidence contradicting their preferred image of healthiness.

1	Plants need water to give rigidity to their cells, but water stress also produces other, more subtle effects.
2	The stressed plant will spend more time with its stomata closed.
۷	The stressed plant will spend more time with its stomata closed.
3	These are the pores, each opened and closed by the expansion and contraction of a pair of guard cells, through which
	gases are exchanged and from which water evaporates.
4	Keeping stomata closed reduces water loss, but a reduction in the rate of gas exchange implies a reduction in the rate of
	photosynthesis.
- 5	The plant will grow more slowly and will be smaller than it would otherwise be, and growth is inhibited before the plant is
,	The plant will grow more slowly and will be smaller than it would otherwise be, and growth is inhibited before the plant is
	so short of water that it wilts visibly.
6	When an adequate amount of water becomes available to a formerly stressed plant it will increase its production of foliage,
	but in the case of a crop plant its final weight will never be greater than that of an unstressed plant and usually it will be
	smaller.

1	The interpretation of quantitative and numeric data is among the factors relevant to the processing of science
	communication.
2	Although communicators share numeric data (e.g., stock prices, disease risks, or weather forecasts) with lay publics because they presume it is useful in decision-making, the same data can evoke widely different interpretations and conclusions
	depending on the recipient.
3	Recent work has found that people with less numeric literacy (numeracy) tend to extract very different meaning from data,
	such as interpretation of expected likelihoods, than those with higher numeracy.
4	But the more numerate also will interpret quantitative information heuristically to make faster judgments.
5	This has been found in portrayals of risks and uncertainties when people overvalue gains following a loss or exaggerate
,	This has been round in portuguis or risks and affect antices when people overvalue gains ronowing a ross of exaggerate
	inferences made from the most recent data in a trend.
6	Some work, however, suggests that less numerate people may be more inclined to rely on these heuristics, which tend to
	yield biased interpretations of quantitative data.
